Mean	*45	- 45	*321	*110	*117	*129

Symbols:

* 1918 Exceeds 1898 in Second Feet.
*
- 1918 is less than 1898 in Second feet.

Mean for the Six Months Period:

1898 is 318 C.FS.
1918 is 431 C.F.S.

Total Acre Feet for the Six Months Period:

1898 is 116,220 Acre Feet.
1918 157,208 Acre Feet.

Explanatory Note; This table is given as a comparison of Minimum years,or unusual years, in the two periods.

It will be observed that in the first period the year 1889 is the lowest year,and is not complete for the six months, for this reason the next lowest -- 1898, is selected. It will also be observed in the second period 1905 is the lowest year,and 1918 is the next lowest year,and conforms in place of magnitude to 1898 of the first period.

It is also desired to show the comparison of unusual years a considerable period of time apart,in this case twenty years,and to show the developement of the system and its behavior in a recent year durthe critical period.

It is well to note the August flow in the first period is 42 per cent of the mean,and the August flow in the second period is 58 per cent of the mean. And the August flow in the second period is 188 per cent of the August flow in the first period.

Defendants percentage of award recieved	115	113	100	101	105	95	101

Note: The foregoing table is made up from daily sheets of distribution, a difference of one per cent in grand total exists on August 7 from table "Summary Of Total Measurements Utah Valley and Provo Canyon Showing Inflow In Valley And Canyon." This variance was occasioned by not knowing discharge of Waterworks of Provo City at time sheets were made. To avoid confusion it is deemed best to make the table correspond to the sheets rather than apply the small correction.

Tabulation of Flow and Distribution of Provo River for August 1918.

Table showing Measurements of Provo River in Provo Valley and Distribution to dependents in Provo Valley, upon Lights under the award of 279 Sec. feet and priority of Provo Reservoir Company by the Blue Cliff award and Wright Estate and Dixon water.
Actual Measurements and distribution are underscored, balance interpolated by daily discharge of River as shown at Provo stations.

U. S. G. S. FOURTEENTH ANNUAL REPORT, PAGE 123-124.

The gagings of this stream have been continued at the point in Provo canyon about 6 miles from the city. For a description of this river reference should be made to page 72 of the Eleventh Annual Report, part 2, and for the fluctuations of discharge to Pl. XCIV of the Twelfth Annual Report. The data obtained since the publication of these volumes are given in the following table and are shown upon the accompanying diagram forming the upper half of Fig. 19:

BULLETIN 140; pages 234-235.

PROVO STATION, ON PROVO RIVER. 1895.

This locality is in the canyon, about 6 miles from the city of Provo, as described in Bulletin 131, page 59. The observer is Henry V. Smith, a farmer, living about 1 1/2 miles from the gage. Observations are made each morning. The gage is inclined and fastened to stakes set in the ground. The station is equipped with a cable, a boat, and also a suspended car, so that either boat or car can be used. From the measurements made during 1895, and those of previous years, Professor Fortier has constructed a rating table which is fairly applicable to the observations.

List of discharge measurements made on Provo River in Provo Canyon, Utah.

A continuous record has been kept of Provo River since July of 1889. The average flow for the driest months of past years are as follows:

	Second feet.
September, 1889	145
September 1890	244
September, 1891	314
August, 1892	201

The following is the record for 1895:

ESTIMATED DISCHARGE OF PROVO RIVER IN PROVO CANYON, UTAH

U. S. G. S. EIGHTEENTH ANNUAL REPORT, PAGES 325,326,327.

PROVO STATION ON PROVO RIVER.

This station is described in Bulletin 131, page 59, and in Bulletin No. 140, page 234. It is located in the canyon about 6 miles from the city of Provo, Utah. It is latitude 40° 19' and longitude 111° 40'. It may be found on the Salt Lake sheet of the Topographic Atlas. The observer is Mr. Henry V. Smith, a farmer. The gage is inclined and fastened to stakes set in the ground. The bench mark is a stone firmly bedded in a bank near the wagon road, about 100 feet southwest of the gage. It is marked "B. M." in black paint, and is 6.95 feet above the zero of the gage. The record of daily gage heights for 1896 is given in Water Supply and Irrigation Paper No. 11, page 79.

U. S. G. S. NINETEENTH ANNUAL REPORT, PART IV. Pages 441-442.

P R O V O R I V E R .

A second power project in Utah has recently been completed on Provo River. Water is diverted about 10 miles above in the canyon and is brought down, not in a pipe, as on Ogden River, but in a flume of semielliptical form, patented by Mr. Guy Sterling, similar to the Santa Ana flume, in southern California. A number of improvements have been introduced in this later construction, especially in the iron braces and methods of tightening them. At the mouth of the canyon where the power works are located a head of something over 300 feet is attained. The object of this plant is the development of electric power to be used in the mines southwest of Provo.

PROVO RIVER.

This river rises on the western slope of the Uinta Mountains, and after receiving a number of tributaries entere what is known as Heber Valley, where considerable irrigation is practiced. After crossing this valley it passes through the Wasatch Mountains in a picturesque canyon, and finally enters Utah Valley, where its summer flow is completely diverted for irrigation purposes. Its flood waters discharge into Utah Lake. The station, which was established July 27, 1889, is at Provo, Utah. Measurements are made by W. B. Dougall and J. S. Baker.

PROVO RIVER NEAR PROVO, UTAH.

This station, established July 27, 1889, is in the canyon about 6 miles from Provo, and above the head of most of the irrigation canals of Utah Valley. The observer is Henry V. Smith. The station is described in Water-Supply Paper No. 38, page 338. The results of measurements for 1899 will be found in the Twenty-first Annual Report Part IV, page 399. During 1900 the following measurements were made by C. C. Babb and W. P. Hardesty:

May 22: Gage height, 5.65 feet; discharge, 834 second-feet.

July 13: Gage height, 4.23 feet; discharge, 174 second-feet.

September 5: Gage height, 4.16 feet; discharge, 162 second-feet.

November 14: Gage height, 4.50 feet; discharge, 257 second-feet.

PROVO RIVER NEAR PROVO, UTAH.

This station, established July 27, 1889, is in the canyon about 6 miles from Provo, and above the head of most of the irrigation canals of Utah Valley. The station is described in Water-Supply Paper No. 51, page 416. The results of measurements for 1900 will be found in the Twenty-second Annual Report, Part IV, page 416. During 1901 the following measurements were madeby G. L. Swendsen:

April 6: Gage height, 4.70 feet; discharge, 353 second-feet.
June 29: Gage height, 4.10 feet; discharge 285 second-feet.
August 13: Gage height, 4.10 feet; discharge, 211 second-feet.
July 22: Gage height, 4.20 feet; discharge, 223 second-feet.
November 11: Gage height, 4.10 feet; discharge, 224 second-feet.

/ PROVO RIVER NEAR PROVO, UTAH

The gaging station on Provo River, established July 27, 1889, is located in the canyon, about 6 miles from Provo and above the head of most of the irrigation canals of Utah Valley. The diversion works of the company which develop power at the mouth of Provo Canyon for electric transmission to the mines west of Provo, are located about 5 miles above the station. The gage is inclined and fastened to stakes set in the ground. The bench mark is a stone firmly bedded in the bank near the wagon road, about 100 feet southwest of the gage. It is marked "B. M." in black paint, and is 6.95 feet above gage datum. The channel is straight for some distance above and below the station. The bed of the river is gravel and not liable to change. The equipment consists of a cable, car, and tagged wire.

WATER-SUPPLY PAPER NO. 100. Pages 142, 143 and 144.

PROVO RIVER AT MOUTH OF CANYON, NEAR PROVO, UTAH.

This station was established July 27, 1889, by Samuel Fortier. It is located about 6 miles north of Provo and above the head of most of the irrigation canals of Utah Valley. The diversion works of the company which develop power at the mouth of Provo Canyon for electric transmission to the mines west of Provo are located about 5 miles above the station. The Heber branch of the Denver and Rio Grande Railway passes within 20 feet of the new gage rod. The station is one-eighth mile above the county bridge. The old gage is an inclined rod set on the left bank. The new gage is a vertical aspen stick set on the right bank 90 feet northeast of the old gage. Both gages read 4.80 feet when the new gage was installed, but the zero of the new gage is 0.10 foot above the zero of the old gage. The gage is read twice each day by L. T. Walter. Discharge measurements are made by means of a cable and car located at the gage. Instead of using a tagged wire, the cable has been marked with white paint every 3 feet. The initial point for soundings is the first white mark on the cable south of the vertical post which supports the cable on the right bank. The channel is straight for 200 feet above and for 100 feet below the station. The right bank is steep and rocky and has an elevation of about 10 feet above the zero of the gage. The left bank is sloping and has an elevation of about 7 feet above the zero of the gage. It is liable to overflow at flood stages. The bed of the stream is composed of boulders and is permanent. The current is swift and at flood stages has a velocity that is too high for accurate measurement. There is one channel up to the point where the river overflows the left bank. Above this stage there are two channels. The bench mark is a cross chiseled in a limestone rock about 1 foot square, which bears south 15° E. and is 100 feet distant from the old gage. Its elevation is 6.98 feet above the zero of the old (inclined) gage. The letters "B. M." are chiseled in the rock.

The observations of this station during 1903 have been made under the direction of G. L. Swendsen, district hydrographer.

November	77	48	63.0	3,759
December	81	31	56.0	3,443
The period				25,870

a Flow began May 15.

NOTE: To get total flow of Provo River at head of diversiondams, the flume dischage should be added to that of the gaging station given above.

83

PROVO RIVER BASIN.

DESCRIPTION OF BASIN.

Provo River has its source in the Uinta Mountains and flows westward in a steep, narrow canyon, until it reaches Heber or Provo Valley, through which it winds in a well-defined channel. Leaving the valley, it flows southwestward, cutting through the Wasatch Range in another steep, narrow, and extremely rough canyon, and finally discharging its surplus waters into Utah Lake.

In the mountain regions the principal rock is a compact limestone. Except in Heber Valley there is but little soil in any portion of the basin. Small groves of fir and aspen are, however, scattered over almost the entire area, and there is a light growth of underbrush. There are no extensive forests, meadows, or marshes. In the canyons the stream receives numerous short and swift tributaries, deriving their principal supply from springs, but a part also from the melting of the snow, which covers portions of the high mountains during the entire year. The highest peaks reach elevations of about 13,000 feet.

Heber Valley, which comprises an area of about 20 square miles, is an irrigated farming district, composed of a deposit of loose bowlders, gravel, and soil, very porous. Most of the water comes from the main stream, though a part is received from small creeks which enter the valley from the south. The most important of these is Daniels Creek, into which some water is diverted from Strawberry River, a tributary of Green River, by three small canals in low passes at the head of the creek.

There are a few lakes at the head of the river, but they are so small that they probably have little effect in regulating the flow. There is no storage on the stream at present, but a few possibilities exist which will doubtless be developed in the future, as the entire stream, after being used at the mouth of the canyon for the development of power, is now utilized on lands in the vicinity of Utah Lake, and the supply is altogether insufficient.

PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM, NEAR PROVO, UTAH.

This station was established March 1, 1905. It is located about three-fourths of a mile up the river from Upper Falls, a station on the Provo Canyon branch of the Rio Grande Western Railway, about 4 miles above the mouth of the canyon and 800 feet south of the canyon road, in J. W. Slick's pasture. It is about one-half mile above the Telluride Power Company's dam and above all diversions into Utah Lake Valley. The object of the station is the collection of data concerning the amount of water passing from the river into this valley.

The channel has a slight uniform curvature for about 200 feet above and 300 feet below the station, describing approximately the arc of a circle. Both banks are sufficiently high to prevent overflow; the left bank is formed by the Rio Grande Western Railway grade. The bed of the stream is composed of well-compacted rock and soil, is comparatively smooth, and is not liable to shift, but a slight growth of moss occurs from the time of the spring flood until freezing weather. The velocity is low near the right bank, but increases uniformly to a point near the left. The discharge may vary from 100 to 1,400 second-feet. Conditions of free flow exist except for a very shoft distance near the left bank.

Discharge measurements are made by means of a cable and car. The cable is marked at 4-foot intervals, beginning at the north support, which is the initial point for soundings.

Daily gage readings are made, without expense to the Geological Survey, by the Telluride Power Company, the observationsbeing under the direction of E. A. Briscoe, an engineer at the power house about 4 miles below the station. The gage is of the inclined type and consists of a 4-by-4 inch by 16-foot fir, bolted to a vertical cedar post embedded in the bank at the water's edge and to a box-elder stump at the shore end, about 25 feet upstream from the cable on the left bank. It is graduated with saw cuts and paint to read vertically The gage is referred to bench marks as follows: (1) A 4-inch iron

85

pipe with a metallic cap, set 3 1/2 feet in the ground at a point 12 feet from the north cable post, under a fence; this has an elevation of 7.31 feet above gage datum and is so stamped on the top. (2) A projecting point, marked with black paint, on a limestone ledge in a railroad cut about a foot above the track and 22 feet upstream from the line of the gage; elevation, 17.18 feet above datum of gage.

DISCHARGE MEASUREMENTS OF PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM, NEAR PROVO, UTAH, IN 1905.

31		209		630		245	162		193		218

NOTE: Discharge February 12-16 assumed as 238 second-feet, on account

of ice conditions. A rating table was used to obtain daily discharge February 1 to July 4. The daily discharge July 5 to December 31 was obtained by indirect methods, as applied to shifting channels. The effect produced by the existence of moss at this station seems to be about the same as by a shifting of the bed i. e., the moss seems to collect sediment and make a soft coating over thebed of the stream, but does not affeat flow near surface.

ESTIMATED MONTHLY DISCHARGE OF PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM, NEAR PROVO, UTAH, FOR 1905.

PROVO RIVER AT MOUTH OF CANYON, NEAR PROVO, UTAH.

This station was established July 27, 1889. It is located about 6 miles north of Provo about 1,000 feet above Olmstead Station, on the Provo Canyon branch of the Rio Grande Western Railway, and 1,200 feet above the power house of the Telluride Power Company.

The station was originally established to determine the total flow of the Provo above all diversions to Utah Lake Valley; but since that time a small canal has been taken out about 3 miles above the station and the system of the Telluride Power Company has been extended by a new flume line of sufficient capacity to divert the entire normal flow of the stream. The power plant of the Telluride Power Company has been rebuilt at a point about 1,200 feet below the station, the tailrace discharging directly into the canals at the mouth of the canyon. Practically no water now passes the station except the flood discharge and a small portion of the side drainage between the power company's dam and the gaging station, the greater part of the side drainage being diverted into the flume at various points along the line. The station is thus of little importance, but it is maintained at an extremely low cost, since the gage readings are made by the Telluride Power Company and the discharge curve is so well defined that but few more measurements are necessary.

The channel is straight for about 200 feet above and 100 feet below the station. The right bank is steep and rocky and does not overflow; the left is somewhat low and sloping and is liable to overflow at extreme flood stages. The bed of the stream is composed of bowlders and soil and is very rough, but permanent. The velocity is high, ranging from 4 to 6 feet per second. Ice forms near the banks and appears also as drift or floating ice. It is, however, limited in quantity and probably never piles up or gorges. There is no anchor or needle ice at any time.

Discharge measurements are made by means of a cable and car. The cable is marked at 3-foot intervals with white paint. The initial point for soundings is the first white mark on the cable south of the

90

vertical post that supports the cable on the right bank. A guy line is stretched across the stream about 40 feet above the station and is found useful at all stages.

The original gage was of the inclined type and consisted of a piece of Oregon fir attached to vertical posts embedded in the left bank about 2 feet below the line of the cable. The present gage, daily readings of which are made under the direction of E. A. Briscoe, an engineer at the power plant, is a vertical piece of aspen driven into the stream bed and supported at the top by a horizontal piece buried in the bank. It is located on the right bank about 30 feet above the line of the cable. Simultaneous readings on the two gages are found to be equal, but the zero of the new gage is 0.10 feet above that of the old one. The bench marks are as follows: (1) A cross chiseled in a limestone rock about 1 foot square, 100 feet S. 15° E. from the old gage; elevation above old gage datum, 6.98 feet. (2) A standard United States Geological Survey metallic plug, cemented in the top of the south abutment of the highway bridge about one-eighth mile below the station; elevation above zero of gage, 4.75 feet. (3) A cross chiseled on the top of a bowlder projecting 1 foot above the ground, 126 feet N. 75° W. from the north post supporting the cable; elevation above zero of gage, 11.21 feet.

Information in regard to this station is contained in the following publications of the United States Geological Survey (Ann-Annual Report; Bull= Bulletin; WS= Water-Supply Paper.):

Description: Ann 14,ii,p 123; 18,iv,pp 325-326; Bull 131,p 59; 140,p 234; WS 16,p 162; 28,p 146; 38,pp 338-339; 51,p 416; 66,p 123; 85,p 88; 100,pp 140-141, 142-143; 133,pp 261-262.

BULLETIN 131, PAGES 59-60.

PROVO STATION, ON PROVO RIVER.

The Provo River, rising in the Wasatch Mountains, southeasterly from Salt Lake City, Utah, flows westerly through open valleys, and finally cuts a deep canyon, discharging upon the lands east of Utah Lake. Near and below the mouth of the canyon its waters are diverted by numerous canals on both sides of the stream. A gaging station was established in the canyon above the heads of these canals, at a point about 6 miles from Provo City, observations being begun on July 27, 1889. The channel at this point is nearly straight for several hundred feet; the bottom of the river is rocky and does not appear to change. The bank on the north side is sufficiently high to confine all of the waters, but on the south side a rise of 2 feet above low water causes the stream to spread over a rocky bar. Measurements can be made with great accuracy during low water, but at times of flood the results are not so good. The station is equipped with a cable, tag wire, and boat, from which measurements are made. The gage is inclined. The bench mark is on a stone firmly bedded in a bank near the wagon road, about 100 feet southwest of the gage. It is marked "B. M." in black paint, and is 6.95 feet above the zero of the gage. This station was inspected October 24 by Mr. Arthur P. Davis, who found for a gage height of 4.38 a discharge of 338 second-feet. The observer lives at some distance from this point, and there are some doubts whether his readings of heights are entirely reliable. They are given as reported, together with the rating table constructed from measurements made in preceding years.

1893-4

PROVO STATION ON PROVO RIVER.

This station, described in the Eighteenth Annual Report, Part IV, page 325, is located in the canyon about 6 miles from the city of Provo, Utah. The observer is Henry V. Smith, a farmer. The gage is inclined and fastened to stakes set in the ground. The bench mark is a stone firmly bedded in a bank near the wagon road, about 100 feet southwest of the gage. It is makred "B. M." in black paint, and is 6.95 feet above the zero of the gage. The banks are medium high. The channel is straight for some distance above and below the station. The bed of the river is gravelly and the velocity is medium swift. The following discharge measurements were made in 1897 by W. B. Dougall:

May 7, gage height, 6.25 feet; discharge, 1,818 second-feet.

May 14, gage height, 6.05 feet; discharge, 1,681 second-feet.

May 24, gage height, 6.53 feet; discharge, 2,454 second-feet.

June 4, gage height, 5.35 feet; discharge, 1,167 second-feet.

June 21, gage height, 4.60 feet; discharge, 564 second-feet.

August 7, gage height, 4.10 feet; discharge, 306 second-feet.

November 26, gage height, 4.40 feet; discharge, 436 second-feet.

WATER-SUPPLY PAPER NO. 38; PAGES 338, 339 and 340.

PROVO RIVER AT PROVO, UTAH.

This river rises on the western slope of the Uinta Mountains and after receiving a number of tributaries enters what is known as Heber Valley, where considerable irrigation is practiced. After crossing this valley it passes through the Wasatch Mountains in a picturesque canyon, finally entering Utah Valley, where its summer flow is completely diverted for irrigation purposes. Its flood waters discharge into Utah Lake. The gaging station, established July 27, 1889, is located in the canyon, about 6 miles from Provo and above the head of most of the irrigation canals of Utah Valley. The diversion works of the company which develop power at the mouth of Provo Canyon for electtic transmission to the mines west of Provo, are located about 5 miles above the station. The gage is inclined and fastened to stakes set in the ground. The bench mark is a stone firmly bedded in the bank near the wagon road, about 100 feet southwest of the gage. It is marked "B. M." in black paint, and is 6.95 feet above gage datum. The channel is straight for some distance above and below the station. The bed of the river is gravel and not liable to change. The equipment consists of a cable, car and tagged wire. The results of measurements may be found as follows: 1896, Eighteenth Annual Report, Part IV, page 226; 1897, Nineteenth Annual Report, Part IV, page 442; 1898 Twentieth Annual Report, Part IV, page 468; The following measurements of discharge were made by W. B. Dougall and J. S. Baker in 1899:

May 8, gage height, 4.70 feet; discharge, 496 second-feet.

June 29, gage height, 6.70 feet; discharge, 1,745 second-feet.

July 13, gage height, 5.22 feet; discharge, 535 second-feet.

August 16, gage height, 4.69 feet; discharge, 340 second-feet.

September 4, gage height, 4.60 feet; discharge, 352 second-feet.

UTAH LAKE.

This freshwater lake receives the surplus waters and seepage of a number of streams that receive their water supply from the Wasatch Mountains, the principal ones being Currant Creek, Spanish Fork, Hobble Creek, Provo River, and American Fork. The ordinary flow of these streams is diverted, on their appearance from the canyons, to irrigate the lands of Utah Valley. A gaging station has been maintained on Provo River, as described on page 338 of this report. A number of miscellaneous measurements were made during 1899 on the other tributaries as well as on the canals diverting waters from the same during the last season. On May 11 Spanish Fork, at the second bridge in the canyon, was discharging 679 second-feet; May 10, Hobble Creek, at the second bridge in the canyon, above Springville, was discharging 244 second-feet; American Fork, on May 9, was carrying 106 second feet, with a gage height of 0.1 foot, on a temporary gage established that day. The following table shows the discharge of a number of canals in Utah County as determined by J. S. Baker:

DISCHARGE OF CANALS IN UTAH COUNTY, UTAH,

SOURCE PROVO RIVER. FOR 1899.

Date	Stream.	Source.	Discharge.	Remarks.

WATER-SUPPLY PAPER NO. 52, PAGES 498, 499, 501, 502 and 503.

IRRIGATION IN UTAH VALLEY, UTAH.[1]

Introduction.

During the latter half of the month of August, 1899, data were obtained for a brief report on the irrigation systems of Utah Valley. Information regarding the history, the area irrigated, etc., was given by the presidents and directors of canal companies, by water masters, and by those most closely connected with irrigation along the various streams. In many cases the statements were from memory, although in most cases they were from records. Frequently it was necessary, owing to lack of time in which to make observations, to accept approximate estimates from those who contributed the information. In view of these facts the data are necessarily incomplete and in some cases are inaccurate, but they give, in a general way, the facts as they existed.

Utah Valley is in the north-central portion of the State, between the high Wasatch Range on the east and the low Lake Mountains on the west. There are about 150,000 acres of irrigable land in Utah County, most of it in Utah Valley. In 1890 there were 40, 195 acres cultivated, and 36,486 acres irrigated; in 1899 there were about 65,000 acres irrigated. Utah Lake occupies, when at a mean elevation or "compromise line," about 84,000 acres in the northwestern part of the valley. The agricultural land lies along the eastern and southern sides. The upper lands consist of gravel, sand, and loam, while the lower lands bordering the lake are sandy loams and in many places adjacent to the lake are marshy.

Water for irrigation is supplied by Provo River, Spanish Fork, American Fork, Hobble Creek, Peteetnetr Creek, Current Creek, Summit Creek, Rock Canyon Creek, Goshen Warmsprings Creek, Salem Pond, Smith Brothers' spring, Mapleton Union or North reservoir, South Mapleton reservoir, and Mount Nebo reservoir. The principal facts in regard to these sources of supply are given in the following table and on succeeding pages:

109

1 Report of J. S. Baker.

STREAMS IRRIGATING LANDS IN UTAH VALLEY IN 1899

a Approximate.
b Some canals discontinue in low-water season.
c Orchard and vineyard.

110

The methods of irrigation throughout the entire valley are flooding for small grains and grasses and the furrow method for orchards and vegetables. The water is distributed on a time basis.

PROVO RIVER.

Provo River is the largest stream entering Utah Valley. It has its source in the summit of the Uinta Mountains, on the boundary line between Summit and Wasatch counties, and very near the sources of Bear, Weber, and Duchesne rivers. For about 18 miles it flows through a precipitous canyon, which in cases of heavy rainfall yields a large run-off. The river is therefore subject to great fluctuation. At the upper end of Provo Canyon is a large valley of the same name. This valley is useful to the lower irrigators as an underground storage reservoir. A part of the water of the river is applied to the land of the valley during the early part of the season, and reaches the river again by seepage shortly after the commencement of the low-water period, thus increasing the flow during that season. Indeed, it has been suggested by the people of Provo that the irrigators of the upper valley be paid to irrigate the uncultivated lands of that valley so as to still further increase, by seepage, the flow of the river below at a time when water is most needed. Since 1883 there have been but four years in which Provo River has carried a sufficient quantity of water to supply the needs of the irrigators below.

The water of the river is allotted as follows: Blue Cliff canal, Timpanogas canal, Provo Bench canal, one-eighth; Robert's ditch, Park & Nuttall's ditch, Bomb & Richardson's ditch, Richmond & Penrod's ditch, Stubbs & Fergeson's ditch, West Union Canal, two-fifteenths; Upper East Union canal, one-twelfth; Lake Bottom canal, one-fifteenth; Wast Union canal, Factory race, City race, and Tanners, forty-three hundredths; and Little Dry Creek canal, one-fifteenth.

BLUE CLIFF CANAL.-- This is the first canal diverting water from Provo River. It heads about 2 1/2 miles above the mouth of Provo Canyon, on the north side of the stream. The greater part of it was

built by the labor of the owners, but small portions were built under contract. In connection with this canal there is contemplated a reservoir on Provo Bench, three-fourths of a mile northwest from the mouth of Provo Canyon, with an area of 20 acres, a depth of 10 feet, and a capacity of 200 acre-feet.

TIMPANOGAS CANAL.-- This is the second canal diverting water from the river. It was built entirely by the labor of the appropriators. Measurements made July 9,1897, by water commissioner, Mr. A. L. Booth, of Provo, show a discharge of 7.27 second-feet. An annual tax of 50 cents per share, to pay the water master and general expenses of operating, is levied on the stock of the company. Considerable trouble has been experienced by frequent breaks in the embankment, which have deprived the irrigators of the use of water for a considerable length of time. Measurements for seepage loss were made August 16, 1899 one near the head and one 9,500 feet below. At the upper point the discharge was 10.40 second-feet; at the lower point it was 7.83 second-feet, showing a loss of 2.57 second-feet, or 24.6 per cent of the discharge at the head. This is equal to a loss of 2.6 per cent per 1,000 feet.

PROVO BENCH CANAL. -- This is the third canal diverting water from the river. It heads near the mouth of the canyon, on the west side of the stream. The diverting dam is made of two large logs buried to their tops, horizontally, in the bed of the stream, at right angles to the current. The lower log which is 10 feet farther downstream is the higher. On top of the logs planks are spiked transversely. An apron of 2-inch plank extends from the crest of the dam 20 feet downstream. On top of the crest and extending along it is a plank 10 inches high, placed on edge. The gates are two in number, each 7 feet high, 6 feet wide, and of 2-inch plank. They are operated by a rack and pinion and hand lever. The original water rights were acquired by appropriation, but later the canal was enlarged and water to fill it was purchased. Measurements for seepage on this canal were made

August 17, 1899. The loss from that source and from evaporation was 4.31 second-feet (equal to 7.4 per cent of the amount at the head) in a distance of 1.5 miles. There are five small ditches diverting water from the river and from what is known as City Creek. Two of them--Robert's ditch and Park & Nuttall's ditch,- are on the west side of the river, and three of them--Bomb & Richardson's, Richmond & Penrod's, and Stubbs & Furgeson's--are on the east side of the river. Measurements of these ditches were made August 17 and 18, 1899, the results of which are given in the table on page 502.

WEST UNION CANAL-- This canal is the fourth one diverting water from Provo River. It heads 1 mile below the mouth of Provo Canyon, on the west side of the stream. It was constructed in 1875-76 by day labor. In 1897 the West Union Canal Company consolidated with the Enterprise Canal Company under the name of the East Union Canal Company, and the canal was enlarged so as to carry the supply of both companies. The water has a rental value of $2 per share per annum. Measurements made on July 9, 1897, showed a discharge of 29.3 second-feet, and those made on August 4, 1897, a discharge of 30.6 second-feet. The interest in the canal is separate from that in the land; water rights do not go with the land, but are bought and sold as other property. Each owner can sell or tent his proportion of the water if he does not care to use it, but if he does not sell or rent it the company can do so and the revenue goes into the treasury of the company.

UPPER EAST UNION CANAL.-- This is the fifth canal diverting water from the river, and the uppermost from City Creek, an old river channel through which irrigation water for the city of Provo is taken to the four canals serving it. The construction of the Upper East Union canal was begun in 1871 and was completed in 1874. It was built by day labor of the appropriators and by contract. The water rights were acquired by original appropriation. One share of stock in the company covers the right to the use of enough water to irrigate 1 acre of land. The canal was designed to carry 30 second-feet of water. On July 9, 1897, there were 32.35 second-feet flowing in it, and

113

on August 4, 1897, 21.45 second-feet. Measurements made in 1899 will be found in the table on page 503. The loss in seepage on August 17, 1899, in a distance of 1 mile, was 0.75 second-foot, or 2.65 per cent of the amount at the head of the canal.

LAKE BOTTOM CANAL.-- Tgis is the sixth canal diverting water from the river, and the lowest from the west side. It is taken out about 4 miles below the mouth of Provo Canyon. It was constructed in 1861, by the labor of the appropriators. Measurements were made July 9, 1897, near the head of the canal, and showed a discharge of 15.78 second-feet; those made August 4, 1897, showed a discharge of 12 second-feet. A large amount of water seeps into this canal from the irrigated land above, which consists of a deep gravel deposit. Being supplemented by seepage water it is not so subject to shortage as are the canals above.

EAST UNION CANAL. -- This is the seventh canal diverting water from Provo River. It is supplied through City Creek. It is nearly parallel to the Upper East Union canal, at an average distance of five-eighths of a mile. It was constructed in 1857, by the labor of the appropriators The capacity was designed to be 27 second-feet. In 1874, upon the petition of the owners, the canal was placed under the contract of the city of Provo, for the reason that most of the land under it was within the city. The water rights are valued at from $60 to $70 per acre for farms and $125 per acre for city lots.

FACTORY RACE.-- This race is the eighth canal diverting water from the river. It is supplied through City Creek. It was enlarged in 1872, when an additional amount of water was appropriated. Its capacity is about 67 second-feet. Lake the East Union Canal, it was placed under municipal control in 1874. About three-fifths of the water of this canal is used by the Provo mills for power purposes; the remainder is used for irrigation.

114

TANNER'S RACE.-- This is the tenth canal diverting water from the river. Some of the water is used for power purposes, but after having passed the mills it is again used for irrigation. The capacity of the canal is about 27 second-feet. It was taken under the control of the city of Provo in 1874,

LITTLE DRY CREEK canal. -- This is the last and the oldest canal diverting water from Provo River. Its headworks are near the northwestern part of the city of Provo. It was constructed in 1852, by the labor of the appropriators. On July 9, 1897, a measurement was made which showed a discharge of 12.5 second-feet; on August 5, 1897, another measurement was made which showed a discharge of 8.8 second-feet. Measurement made in 1899 will be found in the table on page 503.

WATER-SUPPLY PAPER NO. 212, PAGES 37, 38 and 39.

PROVO RIVER BASIN.

DESCRIPTION OF BASIN.

Provo River has its source in the uinta Mountains and flows west-ward in a steep, narrow canyon until it reaches Heber or Provo Valley, through which it winds in a well-defined channel. Leaving the valley, it flows southwestward, cutting through the Wasatch Range in another steep, narrow, and extremely rough canyon, and finally discharging its surplus waters into Utah Lake.

In the mountain regions the principal rock is a compact limestone. Except in Heber Valley there is but little soil in any portion of the basin. Small groves of fir and aspen are, however, scattered over almost the entire area, and there is a light growth of underbrush. There are no extensive forests, meadows, or marshes. In the canyons the stream receives numerous short and swift tributaries, deriving their principal supply from springs, but a part also from the melting of the snow, which covers portions of the high mountains during the entire year. The highest peaks reach elevations of about 13,000 feet.

Heber Valley, which comprises an area of about 20 square miles, is an irrigated farming district, composed of a deposit of loose bowlders, gravel, and soil, very porous. Most of the water comes from the main stream, though a part is received from small creeks which enter the valley from the south. The most important of these is Daniels Creek, into which some water is diverted from Strawberry River, a tributary of Green River, by three small canals in low passes at the head of the creek.

There are a few lakes at the head of the river, but they are so small that they probably have little effect in regulating the flow. There is no storage on the stream at present, but a few possibilities exist which will doubtless be developed in the future, as the entire stream, after being used at the mouth of the canyon for the development of power, is now utilized on lands in the vicinity of Utah Lake,

117

and the supply is altogether insufficient.

PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM, NEAR PROVO, UTAH.

This station was established March 1, 1905. It is located about three-fourths of a mile up the river from Upper Falls, a station on the Provo Canyon branch of the Rio Grande Western Railway, about 4 miles above the mouth of the canyon and 800 feet south of the canyon road, in J. W. Slick's pasture. It is about one-half mile above the Telluride Power Company's dam and above all diversions into Utah Lake Valley. The object of the station is the collection of data concerning the amount of water passing from the river into this valley. The conditions at this station and the bench marks are described in Water-Supply Paper No. 176, page 50.

PROVO RIVER AT MOUTH OF CANYON, NEAR PROVO, UTAH.

This station was established July 27, 1889, and was discontinued June 30, 1906. It was located about 6 miles north of Provo, about 1,000 feet above Olmstead station, on the Provo Canyon branch of the Rio Grande Western Railway, and 1,200 feet above the power house of the Telluride Power Company. The conditions at this station and the bench marks are described in Water-Supply Paper No. 176, page 53, where are given also references to publications that contain data for previous years.

121

WATER-SUPPLY PAPER NO. 250; PAGES 62, 63, 64, 65, 66 and 67. 1907-1908.

PROVO RIVER BASIN.

Provo River rises in the Uinta Mountains and flows westward in a steep, narrow canyon until it reaches Heber or Provo Valley, through which it winds in a well-defined channel. Leaving the valley it flows southwestward, cutting through the Wasatch Range in another steep, narrow, and extremely rough canyon, and finally discharging its surplus waters into Utah Lake.

In the mountain regions the principal rock is a compact limestone. Except in Heber Valley little soil is found in any part of the basin. Small groves of fir and aspen are, however, scattered over almost the entire area, and there is a light growth of underbrush. No extensive forests, meadows, or marshes exist. In the canyons the stream receives numerous short and swift tributaries which derive their principal supply from springs, but a part also from the melting of the snow that covers portions of the mountains during the entire year. The highest peaks reach elevations of about 13,000 feet above sea level.

Heber Valley, comprising an area of about 20 square miles, is an irrigated farming district. The surface is covered with loose bowlders, gravel, and very porous soil. Most of the water is taken from the main stream, but a part is diverted from small creeks that enter the valley from the south. The most important of these is Daniels Creek, into which some water is diverted from Strawberry River, a tributary of Green River, by three small canals in low passes at the head of the creek.

At the head of the river are a few lakes, but they are so small that they probably have little effect in regulating the flow. No storage is used on the stream at present, but a few favorable sites will doubtless be developed in the future, as the entire flow, after being used by a power plant at the mouth of the canyon, is now utilized in the vicinity of Utah Lake, and the supply is altogether insufficient.

122 The wettest year since records have been kept in this basin was

1907, when the discharge at the station of the Telluride Power Company's dam was 477,000 acre-feet. The driest year was 1905, when at the same station the discharge was 192,000 acre-feet.

The following stations have been maintained in this basin:

Provo River above Telluride Power Company's dam, near Provo, Utah, 1905-1908.

Provo River at mouth of canyon, near Provo, Utah, 1889-1906.

Provo River at Denver and Rio Grande Railroad Btidge, near Provo, Utah, 1905.

Provo River at San Pedro, Los Angeles and Salt Lake Railroad bridge, near Provo, Utah, 1903-4.

PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM NEAR PROVO, UTAH.

This station, which was established February 1, 1905, to determine the total flow of the river into this valley, takes the place of the station at the mouth of the canyon, which has been maintained since 1889. It is located about one-half mile below Forks station, on the Provo Canyon branch of the Denver and Rio Grande Railroad, about 4 miles above the mouth of the canyon.

The station is below South Fork and all other tributaries and above all diversions into Utah Lake Valley. Some water is diverted for irrigation in Heber Valley above the station.

Little ice forms at this station. The gage heights have been somewhat affected by backwater from the diversion down below. This dam was raised about July 12, 1908, and the station had to be moved upstream a wuarter of a mile, as near the forks as possible, but it is still toonear the dam and results since that time have not been satisfactory.

126

NOTE(To preceding table): There was little or no ice during 1907 or 1908. Gage heights July 12 to 24, 1908, were affected by backwater from the diversion dam and have been omitted. Gage heights for the two months previous are liable to be somewhat in error on this account. Gage heights beginning July 25 are for the new station above the old one.

RATING TABLES FOR PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM NEAR PROVO, UTAH.

JANUARY 1, 1906 TO JULY 11, 1908.

Gage height.	Discharge.	Gage height.	Discharge.	Gage height.	Discharge.	Gage height.	Discharge
Feet.	Sec.-ft.	Feet.	Sec.-ft.	Feet.	Sec.-ft.	Feet.	Sec.-ft.
3.50	153	4.60	544	5.60	1,020	6.60	1,560
3.60	181	4.70	588	5.70	1,070	6.70	1,620
3.70	210	4.80	634	5.80	1,120	6.80	1,680
3.80	240	4.90	680	5.90	1,175	6.90	1,740
3.90	272	5.00	726	6.00	1,230	7.00	1,800
4.00	305	5.10	774	6.10	1,285	7.20	1,920
4.10	340	5.20	822	6.20	1,340	7.40	2,040
4.20	378	5.30	870	6.30	1,395	7.60	2,160
4.30	418	5.40	920	6.40	1,450	7.80	2,280
4.40	458	5.50	970	6.50	1,505	8.00	2,400
4.50	500						

NOTE:-- This table is not applicable for ice or obstructed-channel conditions below gage height 5.5 feet. It is based on 14 discharge measurements made during 1905-1907, and is fairly well defined between gage heights 3.7 feet and 5.5 feet. Above gage height 5.5 feet the rating curve is drawn to average the three measurements, two of which were probably made when the gage was affected by backwater from the diversion dam of the power flume. It isnnot the normal curve but probably gives the best average results.

127

JULY 25 TO DECEMBER 31, 1908.

Gage height.	Discharge.	Gage height.	Discharge.	Gage height.	Discharge.	Gage height.	Discharge.
Feet.	Sec.-ft.	Feet.	Sec.-ft.	Feet.	Sec.-ft.	Feet.	Sec.-ft.
2.00	210	2.50	292	3.00	382	3.50	475
2.10	225	2.60	310	3.10	400	3.60	495
2.20	241	2.70	328	3.20	419		
2.30	258	2.80	346	3.30	438		
2.40	275	2.90	364	3.40	457		

NOTE:- This table is not applicable for ice conditions. It is based on 2 discharge measurements made during 1908, and is not well defined. The rating curve is not a normal one as the measurement of October 30 was probably affected by backwater, but it is believed to represent average conditions as they existed during the period.

MONTHLY DISCHARGE OF PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM NEAR PROVO, UTAH, FOR 1906-1908.

a Discharges interpolated July 12 to 24.

PROVO RIVER AT MOUTH OF CANYON NEAR PROVO, UTAH.

This station, which was located about 6 miles above Provo and 1,200 feet above the power house of the Telluride Power Company, was established July 27, 1889, to determine the amount of water available at the mouth of the canyon for irrigating lands near Utah Lake, and was discontinued June 30, 1906. The station established February, 1905, 4 miles above the mouth of the canyon and above the dam of the Telluride Power Company, now furnishes the necessary data, the discharge being practically the same at the two points.

The discharge of the Telluride Power Company's flume has been added to that at the station to give the total of the river. Discharges were omitted from the 1906 report but are included here for comparative purposes. No discharge measurements were made in 1906.

RATING TABLE FOR PROVO RIVER AT MOUTH OF CANYON NEAR PROVO, UTAH, FOR 1905 AND 1906.

Gage height.	Discharge.	Gage height.	Discharge.	Gage height.	Discharge.	Gage height.	Discharge

131

WATER-SUPPLY PAPER NO. 270, PAGES 71, 72 and 73.

PROVO RIVER BASIN.

Description.

ProvoRiver rises in the Uinta Mountains and flows westward in a steep, narrow canyon until it reaches Heber or Provo Valley, through which it winds in a well-defined channel. Leaving the valley it flows southwestward, cutting through the Wasatch Range in another steep, narrow, and extremely rough canyon, and finally discharging its surplus waters into Utah Lake.

In the mountain regions the principal rock is a compact limestone. Except in Heber Valley little soil is found in any part of the basin. Small groves of fir and aspen are, however, scattered over almost the entire area, and there is a light growth of underbrush. No extensive forests, meadows, or marshes exist. In the canyons the stream receives numerous short and swift tributaries which derive their principal supply from springs, but a part also from the melting of the snow that covers portions of the mountains during the entire year. The highest peaks reach elevations of about 13,000 feet above sea level.

Heber Valley, comprising an area of about 20 square miles, is an irrigated farming district. The surface is covered with loose bowlders, gravel, and very porous soil. Most of the water is taken from the main stream, but a part is diverted from small creeks that enter the valley from the south. The most important of these is Daniels Creek, into which some water is diverted from Strawberry River, a tributary of Green River, by three small canals in low passes at the head of the creek.

At the head of the river are a few lakes, but they are so small that they probably have little effect in regulating the flow. No storage is used on the stream at present, but a few favorable sites will doubtless be developed in the future, as the entire flow, after being used by a power plant at the mouth of the canyon, is now utilized in the vicinity of Utah Lake, and the supply is altogether insufficient.

The wettest year since records have been kept in this basin was

132

1907, when the discharge at the station of the Telluride Power Company's dam was 477,000 acre-feet. The driest year was 1905, when at the same station the discharge was 192,000 acre-feet.

The following stations have been maintained in this basin:

Provo River above Telluride Power Company's dam near Provo, Utah, 1905-1909.

Provo River at mouth of canyon, near Provo, Utah, 1889-1906.

Provo River at Denver and Rio Grande Railroad bridge, near Provo, Utah, 1905.

Provo River at San Pedro, Los Angeles and Salt Lake Railroad bridge, near Provo, Utah, 1903-4.

PROVO RIVER ABOVE TELLURIDE POWER COMPANY'S DAM NEAR PROVO, UTAH.

This station, which was established February 1, 1905, to determine the amount of water available for irrigation in Utah Valley, is located about 1 mile above the Telluride Power Company's dam and about 4 miles above the mouth of the canyon and about 11 miles from Provo.

The station is below all tributaries, South Fork entering about one-fourth mile above the station. Some water is diverted above the station for irrigation in Heber Valley, and all the normal low-water flow is diverted for irrigation below the station. The Telluride Power Company diverts water about 1 mile below the station for power development, but returns it to the river at the mouth of the canyon.

The equipment consists of a cable and car and an inclined staff gage. The gage datum was changed July 24, 1908, when the station was established at a point one-fourth mile above the old site.

The records are not affected by ice nor by artificial control above, but there seems to be some back water effect either from the dam below the station or from some unknown cause, and the records since the dam was raised in July 1908, have not been satisfactory.

133

PROVO RIVER ABOVE TELLURIDE POWER CO.'S DAM NEAR PROVO, UTAH.

This station, which is located about 1 mile above the Telluride Power Co.'s dam and about 4 miles above the mouth of the canyon, and about 11 miles from Provo, was established February 1, 1905, to determine the amount of water available for irrigation in Utah Valley.

The station is below all tributaries, South Fork entering one-fourth mile above the station. Some water is diverted above the station for irrigation in Heber Valley, and all the normal low-water flow is diverted for irrigation below the station. The Telluride Power Co., diverts water about a mile below the station for power development, but returns it to the river at the mouth of the canyon.

The equipment consists of a cable and car and an inclined staff gage. The gage datum was changed July 24, 1908, when the station was established at a point one-fourth mile above the old site.

The relation between gage height and discharge is not affected by ice or by artificial control above.

The most recent information regarding conditions at this station indicates that there is no backwater from the dam below, but that the channel has become very unstable, requiring the use of many discharge rating curves. Results obtained at this station for 1909-10 are not good.

DISCHARGE MEASUREMENTS OF PROVO RIVER AT TELLURIDE POWER CO.'S DAM, UTAH, IN 1910.

139

PROVO RIVER AT FORKS, UTAH.

LOCATION: At Forks, Utah, 12 miles above Provo, in the NE 1/4 Sec. 26, T. 5 S., R. 3 E. It is about 600 feet above the mouth of South Fork of Provo River, about 1 mile below the mouth of North Fork, and about 1 1/2 miles above the Telluride Power Co.'s dam.

RECORDS AVAILABLE: October 22 to December 31, 1911. Records have been obtained on Provo River since February 1, 1905. The discharge of the South Fork added to that obtained at this station gives the total flow of Provo River.

DRAINAGE AREA: 600 square miles.

GAGE: Inclined staff on left bank driven into the bed of the stream, and firmly braced.

CHANNEL: Not liable to shift; bed of stream composed of small gravel. One channel during all stages. Both banks are fairly high and not liable to overflow.

DISCHARGE MEASUREMENTS: Made from cable and car 10 feet below gage.

WINTER FLOW: No ice forms at this station.

COOPERATION: Station maintained in cooperation with Telluride Power Co. and State of Utah.

Estimates withheld owing to lack of sufficient measurements.

The following discharge measurement was made by Dort and Gilkison by wading at gage:

October 31, 1911: Gage height, 0.84 feet; discharge, 228 second-feet.

140

DAILY GAGE HEIGHT, INFEET, OF PROVO RIVER AT FORKS, UTAH, FOR 1911.

PROVO RIVER NEAR PROVO, UTAH.

LOCATION: About 1 mile above Telluride Power Co.'s dam, one-fourth mile below mouth of the South Fork, and 1 1/4 miles below the mouth of the North Fork, in the NW 1/4 SW. 1/4 Sec. 26, T. 5 S., R. 3 E.

RECORDS AVAILABLE: February 1, 1905 to December 31, 1911, when it was discontinued and new stations were established on the main river and the South Fork to obtain better conditions for measuring. A station was maintained at the mouth of canyon from 1889 to 1906.

DRAINAGE AREA: 640 square miles.

GAGE: Vertical staff installed June 15, 1909, by the Telluride Power Co., to replace vertical gage which was set July 24, 1908, and washed out June 14, 1909. Datum of gage set June 15, 1909, probably the same as that of gage installed July 24, 1908, but there is no record to this

141

effect. The gage installed February 1, 1905, was an inclined staff on the left bank.

CHANNEL: One channel at all stages except at low water, when a bar near the left bank divides the current of the stream.

DISCHARGE MEASUREMENTS: From car and cable.

WINTER FLOW: No ice form at this station.

DIVERSIONS: A little water is diverted in Heber Valley near the head of the river.

ACCURACY: Law because of shifting channel.

COOPERATION: Station maintained in cooperation with Telluride Power Co.

SOUTH FORK OF PROVO RIVER AT FORKS, UTAH.

LOCATION: At Forks, Utah, 12 miles above Provo, in the NW. 1/4 SE 1/4 Sec. 25, T. 5 S., R. 3 E., at a point about 150 feet above the confluence of the South Fork with Provo River.

RECORDS AVAILABLE: Station established October 22, 1911; records begun November 17, 1911. The discharge of the South Fork added to that of Provo River at Forks will give the total flow of Provo River available for

145

diversion at the Telluride Power Co.'s dam.

DRAINAGE AREA: 30 square miles.

GAGE: Vertical staff driven into the stream bed at the right bank 150 feet above the mouth and 40 feet southeast of the Denver & Rio Grande Railroad tracks.

CHANNEL: Probably permanent; well-defined control 30 feet below the gage composed of gravel and small bowlders. One channel at all stages. The left bank is liable to overflow in extreme floods.

DISCHARGE MEASUREMENTS: Made by wading about 30 feet below the gage.

WINTER FLOW: No ice forms at this station.

COOPERATION: Maintained in cooperation with Telluride Power Co.

The following discharge measurement was made by Dort and Gilkison by wading below gage.

October 31, 1911; Gage height, 2.36 feet; discharge, 35.3 second-feet.

DAILY GAGE HEIGHT, IN FEET, OF SOUTH FORK OF PROVO RIVER AT FORKS, UTAH, FOR 1911

						31		2.30

WATER SUPPLY PAPER NO. 330; PAGES 71, 72, 73, 74 and 75. 1912.

PROVO RIVER AT FORKS, UTAH.

LOCATION: In the S.W. 1/4 N.E. 1/4 Sec. 26, T. 5 S., R. 3 E., Salt Lake base and meridian, at Forks, Utah, 12 miles up Provo Canyon from Provo, Utah, on the highway and railroad from Provo to Heber, and about 1 1/2 miles above the dam of the Utah Power & Light Co. About 600 feet above the mouth of South Fork of Provo River, which enters on the left, and about 1 mile below the mouth of North Fork, entering on the right.

RECORDS AVAILABLE: November 16, 1911, to September 30, 1912. Records have been obtained on Provo River since 1890 By adding the discharge of the South Fork to that obtained at this station the total flow of Provo River will be obtained.

DRAINAGE AREA: 600 square miles.

GAGE: Sloping gage on the left bank, 10 feet upstream from the cable.

CHANNEL: Velocity moderate and uniformly distributed across the section; bed of stream composed of small gravel and likely to shift during meddum of high stages. One channel at all stages. Both banks are fairly high and not liable to overflow.
The maximum depth of the water at gage height 1 foot is 1.7 feet.

DISCHARGE MEASUREMENTS: Made from cable and car.

WINTER FLOW: Ice forms at this station, but ordinarily has no effect on relation of gage height to discharge.

DIVERSIONS: Somw water is used for irrigation in Heber Valley above the station. Station is above all diversions in the visinity of Provo.

ARTIFICIAL CONTROL: None.

ACCURACY: Records fair. Drift lodging on the bents of the wagon bridge

147

below the gage may at times cause backwater.

COOPERATION: Maintained in cooperation with the Utah Power & Light Co.

SOUTH FORK OF PROVO RIVER AT FORKS, UTAH.

LOCATION: In the NW. 1/4 SE. 1/4 sec. 26, T. 5 S., R. 3 E., Salt Lake base and meridian, at Forks, Utah, 12 miles up Provo Canyon from Provo, on highway and railroad from Provo to Heber. It is at a point about 150 feet above the confluence of the South Fork with Provo River.

RECORDS AVAILABLE: November 17, 1911, to September 30, 1912.

DRAINAGE AREA: 30 square miles.

GAGE: Vertical staff gage driven into the stream bed at right bank, 150 feet above the mouth and 40 feet southeast of the Denver & Rio Grande Railroad Co.'s tracks.

150

CHANNEL: One channel at all stages. The left bank is liable to overflow in extreme floods.

DISCHARGE MEASUREMENTS: Made by wading about 30 feet below the gage.

WINTER FLOW: No ice forms at this tation.

DIVERSIONS: None.

ACCURACY: Poor, owing to backwater caused by growth of weeds and by high water on Provo River.

COOPERATION: Gage heights furnished by the Utah Power & Light Co.

The discharge of the South Fork added to that of Provo River at Forks represents the total flow of Provo River available for diversion at the Utah Power & Lights Co.'s dam, 2 miles downstream.

WATER-SUPPLY PAPER NO. 360; PAGES 80, 81, 82, 83 and 84. 1913.

PROVO RIVER AT FORKS, UTAH.

LOCATION: In the S.W.1/4 NE 1/4 sec. 26, T. 5 S., R. 3 E., at Forks, 12 miles up Provo Canyon from Provo, on the highway and railroad from Provo to Heber, and about 1 1/2 miles above the dam of the Utah Power & Light Co. About 600 feet above the mouth of South Fork of Provo River, which enters on the left, and about 1 mile below the mouth of North Fork, entering on the right.

RECORDS AVAILABLE: November 16, 1911, to September 30, 1913. Records have been maintained on the Provo River since 1890. By adding the discharge of the South Fork to that obtained at this station, the total flow of Provo River will be obtained.

DRAINAGE AREA: 600 square miles.

GAGE Sloping gage on the left bank, 10 feet upstream from the cable.

CHANNEL: AND CONTROL: Velocity moderate and uniformly distributed across the section; bed of stream composed of small gravel and likely to shift during medium or high stages. One channel at all stages. Both banks are fairly high and not liable to overflow. The maximum depth of the water at gage height 1 foot is 1.7 feet.

DISCHARGE MEASUREMENTS: Made from Cable and Car.

WINTER FLOW: Ice forms at this station, but ordinarily has no effect on discharge relation.

DIVERSIONS: Some water is used for irrigation in Heber Valley above the station. Station is above all diversions in the vicinity of Provo.

REGULATION: None.

ACCURACY: Records good; Drift that lodges on the bents of the wagon bridge below the gage may at times cause backwater.

COOPERATION: Gage heights and some discharge measurements furnished by the Utah Power & Light Co.

155

The year	1,160	200	368	266,000	

SOUTH FORK OF PROVO RIVER AT FORKS, UTAH.

LOCATION: In the SE. 1/4 sec. 26, T/ 5 S., R. 3 E., at Forks, and about 12 miles northeast of Provo.

RECORDS AVAILABLE: October 22, 1911, to September 30, 1913.

DRAINAGE AREA: 30 square miles.

GAGE: Vertical staff nailed to cottonwood tree about one-fourth mile above confluence with Provo River. Previous to June 15, 1913, a vertical staff on right bank about 1,000 feet below present gage.

CHANNEL AND CONTROL: One channel at all stages. Left bank likely to overflow in extreme floods; shifts frequently.

DISCHARGE MEASUREMENTS: Made by wading.

WINTER FLOW: Discharge relation not affected by ice.

ACCURACY: Records only fair owing to shifting channel. Effect of backwater, which was noticeable at former gage, has been eliminated at new gage.

COOPERATION: Gage-height records and some discharge measurements furnished by Utah Power & Light Co.

PROVO RIVER AT FORKS, UTAH.

LOCATION: In sec. 26, T. 5 S., R. 3 E., at Forks, about 600 feet above mouth of South Fork of Provo River, which enters on the left, about one mile below the mouth of North Fork, entering on the right, a mile above the Utah Power & Light Co.'s dam, and 12 miles up Provo Canyon from Provo, on the highway and railroad from Provo to Heber.

DRAINAGE AREA: 600 square miles.

RECORDS AVAILABLE: November 17, 1011, to September 30, 1914; also at various other stations on Provo River since 1890.

GAGE: Inclined staff on left bank, 10 feet upstream from cable.

DISCHARGE MEASUREMENTS: Made from cable or by wading.

CHANNEL AND CONTROL: One channel at all stages; both banks fairly high and not likely to overflowl maximum depth of water 1.7 feet at gage height 1 foot; bed of stream composed of small gravel and likely to shift. Point of zero flow, gage height 0.5 feet.

WINTER FLOW: Discharge relation not affected by ice, though ice forms at station.

DIVERSIONS: Station is below diversions for irrigation in Heber Valley and above those in vicinity of Provo.

REGULATION: None known.

ACCURACY: Results considered good.

COOPERATION: Gage readings and some discharge measurements furnished by Utah Power & Light Co.

SOUTH FORK OF PROVO RIVER AT FORKS, UTAH.

LOCATION: In the SE. 1/4 sec. T. 5 S., R. 3 E., at Forks, about a quarter of a mile above confluence of South Fork with Provo River and 12 miles up Provo Canyon from Provo, on highway and railroad from Provo to Heber.

DRAINAGE AREA: 30 square miles.

RECORDS AVAILABLE: November 17, 1911, to September 30, 1914.

GAGE: Vertical staff nailed to cottonwood tree on right bank, June 15, 1913 , to September 30, 1914; original gage, a vertical staff 150 feet above mouth of stream, November 17, 1911, to June 14, 1913.

DISCHARGE MEASUREMENTS: Made from foot log or by wading.

CHANNEL AND CONTROL: One channel at all stages; both banks high and not likely to overflow; stream bed is composed of gravel and shifts oc-

163

casionally.

WINTER FLOW: Discharge relation not affected by ice; open-channel rating curves used.

DIVERSIONS: Below all diversions and tributaries.

REGULATION: None known.

ACCURACY: Results poor, because of shifting channel.

The discharge at this station added to that of Provo River at Forks gives the total flow of Provo River available for diversion at the Utah Power & Light Co.'s dam, 1 mile below.

By the Committee on irrigation which was adopted as follows:-

Gentlemen:- In acordance with your instructions of July 12th,1886, your Committee on Irrigation held a meeting with parties interested in the waters of Provo River on July 15th, 1886, and agreed to continue for the season the agreement and understanding entered into between the City Officials and representatives of the various companies and parties interested in the waters of Provo River, and reported to the City Council by its representatives on Jan. 14th, 1884, and appointed Peter M. Wentz to act in connection with the Watermaster to measure and destribute the water in acordance with the various claims as submitted. Their labors marked exhibit and made a part of this report, will show with what success we have met.

A meeting of the above parties was held on July 5th, 1887, and the same parties apointed to continue the measurement and distribution for the year 1887. We also recommend that the Committee continue its labors.

R. Farrer, Chairman.

To the representatives of the various Canal interests in the Waters of Provo River, Gentlemen :-

We herewith submit a report of the measurements of the waters in the different Canals and ditches taking water from Provo River. Commencing July 16, 1886, went first to Timpanogos Ditch and found as follows: Width of opening in dam 48 inches,depth of water at stake above dam 4 inches, amount of cubic feet per minute 154.56, the dam was rather defective, going away just as we were measuring depth, Proportion due said ditch is 1/50 of the River, allowing the amount in the River to be 10,000 cubic feet, Timpanogos as should have 200, and I think if our measurement had not been hurried it would have been developed very near that amount.

Hooper Ditch had very full head of water Dam above gatehead had been closed and made tight with straw had no wier dam and it was impossible to make a satisfactory measurement. We reduced its flow to about what it had been placed at 3 days before by the Watermaster and Superintendants.

170

By the Committee on irrigation which was adopted as follows:-

Gentlemen:- In accordance with your instructions of July 13th, 1886, your Committee on Irrigation held a meeting with parties interested in the waters of Provo River on July 15th, 1886, and agreed to continue for the season the agreement and understanding entered into between the City Officials and representatives of the various companies and parties interested in the waters of Provo River, and reported to the City Council by its representatives on Jan. 14th, 1884, and appointed Peter M. Wentz to act in connection with the Watermaster to measure and destribute the water in accordance with the various claims as submitted. Their labors marked exhibit and made a part of this report, will show with what success we have met.

A meeting of the above parties was held on July 5th, 1887, and the same parties apointed to continue the measurement and distribution for the year 1887. We also recommend that the Committee continue its labors.

R. Farrer, Chairman.

To the representatives of the various Canal interests in the Waters of Provo River, Gentlemen :-

We herewith submit a report of the measurements of the waters in the different Canals and ditches taking water from Provo River, commencing July 16, 1886, went first to Timpanogos Ditch and found as follows: Width of opening in dam 48 inches, depth of water at stake above dam 4 inches, amount of cubic feet per minute 154.56, the dam was rather defective, going away just as we were measuring depth, Proportion the said ditch is 1/50 of the River, allowing the amount in the River to be 10,000 cubic feet, Timpanogos as should have 200, and I think if our measurement had not been hurried it would have been developed very near t at amount.

Hooper Ditch had very full head of water Dam above gatehead had been closed and made tight with straw but no wise defective it was impossible to make a satisfactory measurement. We reduced its flow to about what it had been placed at 3 days before by the Watermaster and Superintendants.

170

Upper East Union. This ditch has a gate that for all practical purposes answers for a wier dam and measures as follows:- Width of opening 58 inches depth at stake 11 inches, amount of water in cubic feet per minute 850.86, amount due 1/2 of the River.

Provo Bench and Irrigation Co. Canal had no wier dam at this date(July 16th, 1886,) our imperfect measurement indicates that this Canal carries a little more than its proportion.

Enterprise Canal, no wier dam at this date estimated to have a little more than its proportion, July 17, 1886, Lower East Union. This ditch has a wier dam and measures width of opening 60 inches, depth at stake 11 inches, amount of water in cubic feet per minute 880.20. Factory Race no weir dam estimated to have its full proportion. City Race no weir dam, Estimated to have its proportion. Tanner Rance,- Dam our of repair, no measurement. Fair proportion. The foregoing was reported to a meeting of Gentlemen representing the different Irrigation Companies, and the Committee on Irrigation of Provo City, together with a recommendation that all ditches and canals be immediately supplied with weir dams, said meeting was held at the Court House, July 17, 1886, at 5 oclock P. M.

July 21, 1886, made the following measurement.

Upper East Union,- Width 58 inches, depth 12 inches, amount of water per minute in cubic feet increased same day 100 feet. Timpanogos,- Width 48 inches, depth 6 1/4 amount in cubic feet per minute 301.44, Hooper,- width of opening 48 inches, depth 12 inches cubic feet per minute 803.04. Provo Bench Canal and Irrigation Co. weir dam opening 87 inches, depth 14 3/4 inches, cubic feet per minute 1982.73. Enterprise,- no weir dam estimated to amount the same as Hooper,- 803.04. Lake Bottom Canal,- no weir dam estimated same as Hooper and enterprise 803.04.

July 22, 1886, City Rance,- width of opening 60 inches depth 8 3/4 inches contents per minute 624.00. Factory Race- width of opening-inches, depth 21 3/4 inches cubic feet per minute 3421.32 waste by small ditch 50.00 total of Factory 3471.32 Tanner Race -

171

width 84 inches depth 7 1/2 inches, cubic feet per minute 693.00, waste by ditch above Lower East Union - width of opening 60 inches, depth 13 1/2, flow per minute in cubic feet 1198.20, Little Dry Creek - no weir dam estimated at 500 cubic feet 500.00 River Bottom a claim of nine hundred and nintoen ten thousandths, 919/1000) under which sundry parties take out water in places the amount of which it is impossible to measure, and very difficult to even guess at, I believe there has been used this season, at a very low estimate 1500.00 cubic feet under the River Bottom claim. Then these measurements of July 21, and 22, as follows:- Upper East Union 1131.24- Timpanogos 301.44 - Hooper 803.04 - Provo Bench Canal and Irrigation Co. 1982.75 - Enterprise 803.04 City Race 624.00 - Facroty Race 3471.32 - Tanner Race 940.00 - East Union 1198.20 - Little Dry Creek 500.00 - River Bottom 1500.00 Total in all 14055.05. Taking 14000. cubic feet as the total of the river then each Canal and ditch should have as follows according to claims submitted Jan. 14, 1884, Upper East Union 1166 2/3 - Timpanogos 280 - Hooper 933 1/3 - Provo Bench Canal 1750 - Enterprise 933 1/3 - Lake Bottom 933 1/3 - City Race 1120 - Factory Race 2100- Tanner Race 1400- East Union 1400- Little Dry Creek 700- River Bottom 1286- 14,002 2/3.

Immediately proceeded to regulate the flow of water in all of the Canals except those under the supervision of the Watermaster in accordance with the above proportion, The water, those that had too much of it was turned off. There were some changes at different times in some few Canals, owing some times to natural causes and perhaps sometimes to the dams and gates being tampered with by individuals unauthorized, I, in company with the city watermaster examined and measured the Races and Canals which are under the control of Provo City on the 27, of July, and examined all of the others at different dates up to the 16, of Aug. when the water of the River was so much increased and the waters of irrigation ditches so decreased that I thought it necessary to continue longer, all of which I respectfully submit.

172

To the representatives of the Various Canals also interested in the Waters of Provo River 1886.

Gentlemen : We herewith submit a report of the measurements of the water in the diferent canals and ditches taking water from Provo River, Commencing July 16th, 1886 went first to Timpanogos Ditch and found as follows width of opening in dam 48 inches depth of water at stake above dam 4 inches, amount of cubic feet per minute 154.56 the dam was rather defective giving way just as we were measuring depth proportion due said ditch is 1/50 of the river allowing the amount in the river to be 10,000 cubic feet. Timpanogos should have 200 and I think if our measurement had not been hurried it would have developed very near that amount.

Hooper Ditch had a very full head of water Dam above headgate had been closed and made tight with straw had no wier dam and it was impossible to make a satisfactory measurement we reduced its flow to about what it had been placed at 3 days before by the watermaster and superintendants.

Uper East Union, This ditch has a gate that for all practical purposes answers for a wier dam and measures as follows. Width of opening 58 inches depth at stake 11 inches amount of water in cubic feet per minute 850.86 amount due 1/12 of the river.

Provo Bench and Irrigation Companyes Canal had no wier dam at this date (July 16 1886) our imperfect measurement indicates that this canal carries a little more than its proportion.

Enterprise Canal. No wier dam at this date Estimated to have a little more than its proportion.

July 17th 1886.

Lower East Union. This ditch has a wier dam and measures Width of opening 60 inches depth at stake 11 inches. amount of water in cubic feet per minute 880.20.

Factory Race no wier dam estimated to have its full proportion.

City Race no wier dam estimated to have its proportion.

Tanner's Race Dam out of repair no measurement fair proportion.

The foregoing was reported to a meeting of gentlemen re-

presenting the diferent Irrigation Companies and the Committee on irrigation of Provo City, together with a recomendation that all Ditches and Canals be immediately suplied with wier dams, said meeting was held at the Court House July 17th, 1886 at 5 oclock P. M.

July 21st 1886 made the following measurement

Uper East Union, Width 58 inches depth 12-1/2 inches amount of water per minute in cubic feet 1031.24 increased same day 100 ft.

100

1131 24

Timpanogos width 48 inches depth 6-1/4 amount of cubic feet per minute 301.44

Hooper width of opening 48 inches, depth 12 inches, cubic feet per minute 803.04.

Provo Bench Canal Co Weir Dam opening 87 inches, depth 14-3/4 inches cubic feet per minute 1982.73.

Enterprise, No wier Dam Estimated to carry about the same as Hooper 803.04.

July 22, 1886, City Race width of openings 60 inches depth 8-3/4 inches contents per minute 624.00.

Factory Race width of opening 84 inches depth 21-3/4 inches cubic feet per minute 3421.32

Waste by small ditch - - - - 50

Factory Total - - 3471.32

Tanners Race Width 84 inches depth 7-1/2

Cubic feet per minute 693.00

Waste by ditch above dam 250.

Total of Tanner's 943.00

Lower East Union Width of opening 60 inches depth 13-1/2 flow per minute in cubic feet 1198.20

Little Dry Creek no wier dam estimated at 500 cubic feet.

River Bottom a claim of nine hundred and ninteen ten thousandths (919/10,000) under which Sundry persons take out water in diverse places, the amount of which it is impossible to measure, and very dificult to even guess at. I believe these has been used this season at a very low estimate 1500 cubic feet under the River Bottom Claim

174

Then the measurements of July 21st and 22nd are as follows:

Uper East Union	1131.24
Timpanogos	301.44
Hooper	803.04
Provo Bench C. & I Co	1982.73
Enterprse	803.04
Lake Bottom	803.04
City Race	624.00
Factory Race	3471.32
Tanner's Race	940.00
East Union	1198.20
Little Dry Creek	500.00
River Bottom	1500.00
	14058.05 Total of all.

Taking 14000 cubic feet as the total of the river then each canal and ditch should have as follows according to claims submitted Jan. 14th 1884.

Uper East Union	1166-2/3
Timpanogos	280
Hooper	933-1/3
Provo Bench Canal	1750
Enterprise	933-1/3
Lake Bottom	933-1/3
City Race	1120
Factory Race	2100
Tanner's Race	1400
East Union	1400
Little Dry Creek	700
River Bottom	1286
	14002-2/3

I immediately proceeded to regulate the flow of water in all of the canals except those under the supervission of the watermaster in accordance with the above proportion. the water in those that

175

had too little was increased, and from those that had to much it was turned off. These were some changes at diferent times in some few canals owing sometimes to natural causes and perhaps sometimes to the dams and gates being tampered with by individuals unauthorized. I, in company with the City Watermaster, examined and measured the Races and canls which are under the control of Provo City on the 27th of July. And examined all of the others at diferent dates up to the 16th of August.

When the water of the river was so much increased and the wants of Irrigation districts so decreased that I thought it unnecessary to continue longer, all of which I respectfully submit.

P. M. Wentz.

176

To the Committee on distribution of the waters of Provo River for the season of 1887, Roger Farrer chairman,

Gentlemen :-

Having been employed by you on the 5th day of July 1887 to measure the water of Provo River in the various canals and ditches taking water therefrom and with the assistance of the City Watermaster, on the part of the city, and superintendants of other and independant canals and ditches to distribute thesame acording to claims submitted Jan 14th, 1884, I hereby report to you my findings and measurements.

On the 6th day of July 1887 went in company with City Watermaster (Gee) N. Barrett, of Uper East Union, Thatcher Hallett of Timpanogos to the head of Timpanogos Ditch in mouth of Provo Canyon all agreed that the flow of water in the river was as much as fifteen thousand cubic feet per minute.

Timpanogos had a small stream evidently not its proportion Supt. Hallett agreed to turn in more and have dame ready for measuring next day. Provo Bench Canal and Irrigation Co carried a large stream they have substantial head-gates provided with locks and a permanent dam built of timbers and plank, there were some willow brush on top of dam which we took off thereby reducing the stream about four (4) inches, Supt Knight agreed to have the weir ready for measuring next day.

Hooper Ditch July 6th, 1887, Large stream, Dam above headgate composed of rock, brush and straw, more water than Co claimed, opened dam and let some go down the river, No weir dam, no representative of the co present.

Uper East Union July 6th 1887, represented by N. Barrett Supt. Width of weir 58 inches, depth 11-1/2 inches flow 908.86 cubic feet per minute.

Enterprise Canal July 6th, 1887 width of wier 72 inches, depth at stake 10-7/8 inches 14.42X72 - 1008.24 cubic feet per minute.

Lake Bottom July 6th, 1887, Found wier dam in the river bottom not far from Carterville, with no visible means of turning

177

water off or on. Am satisfied that it did not have its proportion of water at the dam but saw several streams coming in below the dam which would I think make up its quota if not more. The dam should be placed lower down the stream.

Tanner's Race July 7th, 1887, Impossible to measure, no gate in the Davis Ditch (just above) Estimated at 1100 cubic feet per minute.

Factory Race July 7th 1887 width of wier 84 inches, depth 17-1/2 29.45X84 - 2473.80.

City Race July 7th, 1887, width of wier 60 inches, depth 6 inches 5.90X60 - 354.00

East Union July 7th, 1887 Dam and stake all out of place, impossible to measure.

Little Dry Creek no wier dam estimated to have its proportion of water 1/20.

River Bottom, This claim is 919-10,000 of the river and is taken out on both sides of the river by quite a large number of persons, as to measuring it, I think it is unterly impossible and difficult even to guess at.

Uper East Union July 7th, 1887, width 58 inches, depth 12 inches - 16, 73X58 - 970.34 cubic feet per minute, nearly as much as capable of carrying.

Timpanogos July 7th, 1887 no board for wier dam no representative of the company. flow of water estimated at 3.00 cubic feet per minute.

Provo Bench Canal July 7th, 1887, assisted by Mr. N. Barrett measured as follows: Width 110-1/2 inches depth 11-3/4 inches 16.20X110-1/2 - 1790.10 cubic feet per minute.

Hooper ditch July 7th 1887 no dam full proportion of water.

It will be seen here that although we have been over the whole ground that it is impossible to tell whether our first estimate of the river was correct or not, as some of the ditches were without dams and impossible to measure, but my opinion is that it was very little if any too high.

Tanner's Race July 11th 1887, Width 84 inches, depth 8-1/2

178

inches 10,16X84 = 855,64 waste 40,00 - 895,64 cubic feet per minute.

City Race July 11th 1887 width 60 inches, depth 9 inches, 10.86X60 = 651.60 cubic feet per minute.

Factory Race July 11th, 1887 width 84 inches depth 19 inches 33.29X84 = 2796.36 cubic feet per minute.

East Union July 11th 1887 width 60 inches depth 19-3/4 inches 35.27X60 = 2116.20 cubic feet per minute.

Uper East Union July 11th 1887 width 58 inches, depth 12-1/4 inches 17,26X58= 1001.08 cubic feet per minute.

Timpanogos Ditch July 11th, 1887. Width 47-1/2 inches, depth 7-1/4 inches 7.84X47-1/2 = 372.40 cubic feet per minute. Hallet agreed to turn off to 6-1/4 inches which would be 280.25 cubic feet per minute.

Hooper July 11th, 1887 Assisted by G. W. Gee present J. W. Turner James Smith and Shadrack Holdaway, Width 48-3/4 inches, Depth 12-1/2 inches 17,78X48-3/4 = 866.77 cubic feet per minute levy above the dam too low, when the board was put in the water run over impossible to measure more correctly.

Enterprise Canal July 11th 1887, Width 72 inches depth 9-3/4 inches 12,23X72 = 880.56 cubic feet per minute.

Tanners Race July 12th 1887 width 84 inches depth 8-3/4 inches 10,40X84 = 873.60 waste under gate Davis Ditch 40.00 - 913.60 cubic feet per minute.

Tanners Race at 6 P.M. July 12th 1887 width 84 inches, Depth 8-1/2 inches 9.96X84 = 836.64 waste 40.00 - 876.64 cubic feet per minute.

Provo Bench Canal July 14th, 1887. Width 110-1/2, Depth 11-3/8 inches 15.43X110-1/2 = 1705.01.

Timpanogos Ditch July 14th 1887. Width 47-1/2 Depth 6-1/4 inches 6.28X47-1/2 = 298.30 cubic feet per minute.

Hooper July 14th 1887. width 48-3/4 Depth 31-1/4 inches 19.42X48-3/4 = 946.72.

Enterprise July 14th, 1887 Width 72 inches Depth 9-1/2

179

inches 11, 31X72= 814.32 cubic feet per minute, had not its full proportion but Mr. Samuel Carter had just been turning off water at waste-gate, he said by the requestof John Carter Sen. On account of the Canal being cloged below with sweet clover, causing the water to run over onto said John Carter's land.

Tanner's Race July 15th, 1887.

Width of Dam 84 inches, Depth 9-3/4 inches 12.23 84- 1027.32 cubic feet per minute. Waste at Davis gate 40.00- 1067.32.

City Race July 15th, 1887. Width 60 inches Depth 9-1/8 inches 11.08X60= 664.80 cubic feet per minute.

Factory Race July 15th, 1887. Width 84 inches Depth 23-1/2 inches 45.71X84 - 3839.64 cubic feet per minute.

East Union July 15th 1887 Width 60 inches Depth 15-1/2 inches 24.56X60 = 1473.60 cubic feet.

Little Dry Creek July 15 1887 no Dam.

Lake Bottom July 15th Several streams coming in below wier dam estimated to have its proportion

Hooper Ditch July 23rd 1887 water about 1-1/2 inches below what it should be. I tightened up the waste gate with moss and mud the best I could but it was still a little below, no one of the co. present.

Tanner's Race July 26th 1887 Width 84 inches Depth 11-3/4 inches 16.20X84= 1360.80, besides a waste estimated at 275.00, 1635.80.

City Race July 26th 1887 Width 60 inches Depth 6-3/4 inches 7.05X60= 423.00 cubic feet.

Factory Race July 26th, 1887 Width 84 inches Depth 17-3/8 29.14X84=2447.76 cubic feet per minute.

East Union July 26th 1887 width 60 inches Depth 15-5/8 inches 24.86X60=1491.60

Upper East Union July 26th 1887 Width 58 inches Depth 12-3/4 inches 18.18X58= 1054.44

Timpanogos Ditch July 26th 1887 Width 47-1/2 Depth 4-7/8

180

inches 4.32X47-1/2 = 205.20 . G. W. Gee repaired the dam and increased the flow to a bout 300 feet.

Hooper Ditch July 26th 1887 Width 48-3/4 Depth 13-3/8 inches 19.69X48-3/4= 959.88

Provo Bench Canal July 26th 1887 Could not find the stake estimated to have its proportion.

Little Dry Creek July 27th 1887 No wier Dam. less than its proportion of water, but no means of turning more in.

Enterprise Canal July 27th 1887 in the morning had not its full proportion In the evening Called on Samuel Carter he had been tightening the dam with dirt had more water but not quite up to the mark.

Lake Bottom July 27th 1887, Plenty of water coming in below the wier dam.

River Bottom July 27th, 1887. This in measureable claim has never yet complained of a scarcity of water.

Provo Bench Canal July 29th 1887. Went with J. A. Loveless to wier dam. He put in new stake leveled with spirit level Width 110-1/2 inches Depth 11-7/8 inches 16.46X110-1/2= 1818.83 cubic feet per minute.

Hooper July 29th 1887 width 48-3/4 inches Depth 13-1/4 inches 19.42X48-3/4= 946.72 cubic with some water running around the Dam

Provo Bench Canal August 1st 1887 Width 110-1/2 inches Depth 12-1/8 inches 16.99X110-1/2= 1877.39 cubic feet per minute turned off at head gate so as to reduce it full 1 inch at a point about 40 paces below, where canal was about 20 feet in width, Did not go back to wier that day.

Hooper Ditch August 1st 1887 Width 48-3/4 Depth 12-3/4 inches 18.32X48-3/4= 893.10 Turned off to 12-1/8 reducing it about 60 feet.

Timpanogos August 1st 1887 Width 47-1/2 Depth 6-3/8 inches 6.47X47-1/2= 307.52-1/2- just a little too much, but so little did not go to the head (about 1/2 or 3/4 of a mile) to turn it off. also it would be dificult to get it nearer on account of the imperfect means of turning off or on.

181

Upper East Union August 1st 1887. Width 58-inches Depth 12-3/4 inches and running over a little into the road above wier, to the south 18.32X58=1062.56 turned off to 10-7/8 on stake- to 836.36 cubic feet per minute.

Tanner's Race August 2nd 1887

Width 84 inches Depth 10 inches 12.71X84=1067.64 Waste at Davis Ditch and old waste way - to 300 feet making total of Tanner's Race 1367.64 feet per minute.

Factory Race Augt. 2nd 1887. Width 84 inches Depth 14-3/4 22.79X84= 1914.36 cubic feet per minute.

City Race Augt 2nd 1887. Width 60 inches Depth 4-1/2 inches 3.83X60=229.80 cubic feet per minute.

East Union Augt. 2nd 1887. Width 60 inches Depth 10-1/16 inches 12.83X60= 769.80 cubic feet per minute.

Enterprise Canal August 2nd 1887. Remains about the same as when last measured a little scant if any diference.

Lake Bottom Augt 2nd 1887 Well supplied below the wier.

River Bottom Augt 2nd 1887 unknowable.

Wednesday August 10th 1887.

Went out with City Watermaster (G. W. Gee) 1st to Tanner's Race, Contents or flow 1262.24 cubic feet per minute.

Factory Race Augt 10th 1887 Flow 1585.08 cubic feet per minute.

City Race August 10th 1887 Flow 270.00 cubic feet per minute.

East Union August 10th 1887 Flow 1003.80 cubic feet per minute.

Uper East Union August 10th 1887 Flow 821.28 cubic feet per minute.

Hooper August 10th 1887 Found it 13-1/4 inches on stake- to 932.16 reduced it to 12-1/4= 828.48 cubic feet per minute.

Provo Bench Canal August 10th 1887 Flow 1491.27 cubic feet per minute.

182

Hooper Ditch August 20th 1887, 9 O'clock A. M. Found the Ditch full of water and runing over into Knights field on the west side. Measured at stake 11-1/2 inches without the wier board in. I opened the waste gate and reduced it about one-half in depth. then put in wier board and gave them 12 inches on the stake which is 800.00 cubic feet per minute the amount of this claim, 1/15 judging the river at this time to flow at the rate of 12,000 cubic feet per minute.

All of the foregoing is respectfully submitted this 16th day of February 1888.

Provo City Utah

P. M. Wentz.

To the City Council of Provo City,

Gentlemen :-

I herewith present to your honorable body my report as Water Commissioner for 1895.

You will see that the same is somewhat lengthy and in detail. I do not think previous Commissioners have left a record of their work and findings and I believe the facts which I found to exist are of sufficient importance to be worthy of preserving. I make the report therefore full which I trust will be worthy of a place in your vault and can be used for future reference and comparison.

Yours truly,

J. E. Booth,

WaterCOMMIONER for 1895.

To the City Council of Provo City.

Gentlemen :-

The following is a report of my work as water commissioner appointed for the year 1895 and also my recommendations as to what is needed to avoid furthermore complicated difficulties.

July 1st, 1895.

At the request of Silas L. Allred Watermaster of Provo City a meeting convened at the County Court House, Provo City, Utah, County, Utah, at which meeting were present represented: Provo City by S. L. Allred, Watermaster, Andrew Knudsen and A. Halliday Committee of the City Council on Irrigation.

Provo Bench Canal Co. by Jas. A. Lovelass, Prest.

Upper East Union by James Gray Prest.

Enterprise Canal Co. by J. E. Booth Prest. and

J. A. Warner Supt.

Union or Hooper Canal Co. by George Baum and Sam Carter.

River Bottom by J. E. Booth and George Baum.

J. E. Booth was elected chairman of the meeting and James

186

A. Loveless was elected Secy. On motion of Jas. A. Loveless the several Canals agreed on a division of the waters of Provo River on the basis of the agreement made in January 1884 as recorded in the Provo City records of that date. - Carried -

Said division is a s follows:-

Timpanogos one fifthtieth (1/50). Upper East Union one twelfth (1/12). East Union one tenth (1/10). Factory Race three twentieths (3/20). Tanners Race one tenth (1/10). Holdaways Race two twenty-fifths (2/25). Little Dry Creek one twentieth (1/20). Lake Bottom Canal Co. one fifteenth (1/15). Enterprise Canal Co. one fifteenth (1/15). Hooper Canal Co. one fifteenth (1/15). Provo Bench Canal Co. one eighth (1/8). and the River Bottom nine hundred and nineteen ten-thousandths (919/10,000).

J. E. Booth was appointed as a Commissioner to measure the water and make the division thereon in the presence of the Watermasters if they desire to be present. Costs to be apportioned in proportion to water distributed.

On motion of Andrew Knudsen the questions of a meeting of all the canal interests was left to Provo City to fix time and place.

July 2nd, 1895.

Commissioner J. E. Booth met several of the Watermasters of Provo at the Government measuring point at the mouth of Provo Canyon and found the water registering 4.2 and the board put in by the Govt. which indicated a flow of about 17000 cubic feet of water per minute. The Provo Bench Canal by A. B. Walker Watermaster protested against any measurements or division thereof so long as there was 15000 feet or more of water in the river per minute. The commissioners did not acknowledge the right of the protest and proceeded to the measurement.

The weirs were in an imperfect condition and the Commissioners was satisfied that there was more water in the canal than the measurement showed.

The following are the measurements shown by the weirs where the bad weirs were and estimate of other ways where there were no

187

weirs.

Provo Bench Canal Co. - - - - - - - -	3113.5 feet
McCulloughs and Parks. - - - - - - - -	400.
Hoopers - - - - - - - - - - - - - -	1480.
City Gate. - - - - - - - - - - - - -	4200.
Upper East Union - - - - - - - - - -	1402.
City Water Works - - - - - - - - - -	600.
Stewart Ditch. - - - - - - - - - - -	65.
Boyce. - - - - - - - - - - - - - - -	85.
Enterprise Canal. - - - - - - - - - -	1165.
Total - - - - - - -	1,2510.5

The Commissioner thereupon gave notice that there would be a meeting on July 6th of the several interests to take in consideration the situation as to whether the companies would put in proper gates or risk the commissioners judgment on the matter of the divisions.

July 6th, 1895.

Water interests met pursuant to a call from the Commissioner. Present, Provo City, Knudson and Halliday. Factory. Reed Smoot. Provo Bench Thorn and Walker. Union. S. Carter. Enterprise J. A. Warner. Upper East Union. James Gray. River Bottoms. McCullough. for Roberts, Parks and himself.

Reed Smoot appointed Secretary.

Chairman Booth stated that on the 1st of July we had a meeting and it was agreed that the water be divided in some way as recorded on records of Provo City as in year of 1884. He was appointed to measure water and most of water rights were represented.

The water was measured but was satisfied there was an error. Visited the several Canals. At present it was impossible to make an accurate measurement until some work was done. should decide to leave it with some set of men to divide it as to their judgment or have all parties interested prepare some accurate ways of measurement. The upper East Union and Timpanogos had too much

188

water. Hooper had a little too much. City and Enterprise did not have enough.

William Walker of Provo Bench protested against any measurement when there was 15,000 feet claiming the City interests of 43/100 of 15,000 feet was all they were entitled to and no interest whatever in any over the 15,000 feet.

Commissioner advised that the Provo Bench Canal Co. turn to the City some 350 feet of water and Mr. Walker refused. He told the City Watermaster he was justified in going and taking the water which Commissioner does not know whether he did or not.

It was moved and seconded that we accept the report.

Mr. Knudsen thought it was too late to put in a river dam to measure and thought that the City would be satisfied with the judgment of a commissioner of commissioners and made a motion to that effect,- Carried-

Mr. Knudsen stated: The question of claim of Provo Bench Canal that the City was only entitled to 43/100 of the water up to 15,000 ft. and nothing over, was not so understood by the City or any of the City interest nor would they agree to it. Mr Knudsen moved that each Canal be required to put in river dams on or before June 1st 1896 acceptable to a committee appointed at some future meeting. Seconded and Carried. It was agreed that the representatives of the interests meeting Monday and Thursday evening until further orders at the head of the Enterprise Canal on motion of Knudsen the several Canal interests are invited to appoint a member of the Company to from a Committee to elect a commission to confer with a similar committee from Wahsatch County for the purpose of mutually protecting their water interests at and near the head of the river and that said Committee meet Tuesday 16th.

July 8, 1895.

On this day the water in the several Canals as near as I could ascertain was as follows:-

189

Enterprise Canal, - - - - - - - -1032 feet.

per minute 200 ft of which belonged to River Bottom.

Hooper or Union	1227 feet
McCullough and Parks	350 "
Provo Bench	2465 "
Roberts	200 "
Timpanogos	600 "
Water Works System	500 "
City Race	3844 "
Upper East Union	1844 "
Total	11030 "

River measurement indicated 14400 so our detail measurements seem to be too small. There is probably 1000 feet in River Bottom.

July 9, 1895.

Turned from Provo Bench about 100 feet and from Upper East Union 300 feet. 100 feet from Timpanocos turned to the City 1000 feet and reduced Hooper and McCullough in favor of Enterprise.

July 12th, 1895.

More water in the river this morning so no further changes made. Provo Bench Canal Co. claims to irrigate 4186 acres and North Union with 1/3 of the water irrigates 1749 acres.

July 28, 1895.

River down to 11000 feet.

Provo Bench has	2391	is entitled to	1375.
Roberts	"	60	"	"	"	200

July 30th, 1895.

The Commissioner ordered the following changes made by the

190

Watermaster of Provo City. Take from Provo Bench 300 feet.

Roberts 75 feet, McCullough 150 feet, Hooper 100 feet. Timpanocos 100 feet. Upper East Union 200 feet the same to be given to Provo City and River Bottoms.

At the meeting of the Water interests held at the Court House on the day of July 1895, A Holliday, J. A. Loveless and J. E. Booth were appointed a Committee to confer with the persons and companies among water interest in Provo River in Wahsatch and Summit Counties and in pursuance of said appointment on August 7, 1895. A Halliday and J. E. Booth attended a meeting in Heber City of which meeting the following is an abridged account of the proceedings Meeting was held in the Court House, Heber City, Wahsatch County, Utah, Aug. 7, 1895, 2 P. M.

J. E. Booth of Provo was elected Chairman and Edward Clyde of Heber Secretary.

The Chairman stated the object of the meeting to be to consider the several water interests of Provo River.

Abram Halliday made explanation of the position taken by Provo City and other Provo Interests.

John Crook moved that it is the sense of the meeting to endeavor to settle the water interests of Provo River in a friendly manner and submit it in the Courts of a friendly suit for a decree.

A. Wooten moved that there be a commission of three appointed to formulate a plan of this settlement and A. Hatch moved for an amend by adding: and that they report progress at 8 o'clock this evening,- carried as amended. J. E. Booth, Wm. Buys and A. C. Hatch were selected and the meeting adjourned till 8 o'clock this evening.

The Committee met at A. C. Hatch's office and adopted the following report, to-wit:

Your Committee appointed by this meeting to formulate a plan on which to act to accomplish the object contemplated by the motions passed report that we have considered the same and recommend that:

A Commission consisting of three persons one of whom shall be an officer authorized to administer oaths be selected whose duty it shall be to give notice of the time and place or places to each party in interest, that they will hear such evidence as may be offered, in relation to appropriation of water as to amount and time of said

192

appropriation.

On the said offer of testimony and before it is given the person or Company so offering shall sign an agreement to pay the expenses of said commission or so much thereof as said commission shall approtion to the after said signing of said agreement the said Commission shall take said testimony so offered relating to the following points:

The name of the claimant. The amount of the first appropriation of water. The amount of theland irrigated.

The time and amount of increase of said appropriation to the present. Said testimony shall be taken under oath. Persons interested and who are entitled to give evidence may contest claims of other parties.

After all the testimony is so taken said commission therefrom shall make its findings of fact, which said finding shall be submitted to a subsequent meeting of the water interests and when approved by a majority shall be used as a basis on which to ask the proper court for a decree setting said water rights and all parties accepting the same shall pledge themselves to mutually protect said interests against all persons who are subsequent claimants or who will not join in this settlement or accept said award or finding of fact when agreed on by a majority of the interests pepresented in said Provo River.

8 P. M.- Meeting reassembeled.

J. C. Moulton was elected Secretary as Mr. Clyde could not be present.

The report was presented and amended in two particulars and adopted unamimously as above recorded.

J. R. Murdock moved that the compensation of the commission be not to exceed $400 each per day, with legal mileage and expense of necessary stationery.

On motion it was decided to have the three localities name one of the commissioners.

On motion of J. R. Murdock it is ordered that the said commission consist of regularly admitted attorneys at Law in practice. Mr.

193

Dillon vote No. On motion of A. Halliday the said commission when elected may act if two of them are present and any two may be a quorum.

On motion of A. Wooten the meeting should select two of their three Commissioners and that the people of Woodland shall name at some future time subject to the approval of the other two Commissioners and whey so named and approved shall be the third commissioner. The Woodland people voted against it. The last named motion was passed.

On motion of A. Halliday J. E. Booth was named as one of the commissioners and John Crook named Mr. A. C. Hatch and they two Booth and Hatch were selected as two of the said Commissioners.

Minutes were read and approved and meeting adjourned subject to the call of the commission.

Aug. 13th. 1895.

This day commissioner visited seir and canals. Found at Government measurement 12,000 feet.

The Hooper and McCullough ditches had more than their share of water; all the canals were short of their needs. The Commissioner ordered that the Hooper Canal and McCullough ditch be each reduced 1/2 inch on their surface which was done.

August 31, 1895.

The Commissioners met with the Water Master at the mouth of Provo Canyon and found in the river 11,200 feet of water.

The Timpanocos, McCullough, Provo Bench, Roberts and Upper East Union had more than their share of water and the City had not enough.

The Commissioner thereupon made an order that the water be now divided according to the agreement as fixed in January 1884 the same to apply for the balance of this irrigation season.

The several Water Masters reported afterwards to the commissioner that a division had been made in accordance with the said order and that the same was unanimously accepted.

I as said Commissioner desire to call your attention to

194

the slovenly and unsatisfactory gates at the place of measurements at the several conals with only one exception, and that difficulty will exist in regard to division of the waters of Provo River so long as there are no improvements in said gates and places for measurement the worse the gate the better the opportunity to get more water and there has therefore been a premium on negligence in this regard. I recommend that for economy and satisfaction a proper stone gateway be built at or near the present upper place of division and that it contains gate-ways ona level and divided in proportion to width to the several interests having each company take care of its own water below the point of division.

Provo City in my opinion has spent much more time and means on brush dams tham would have been reqmired toplace in proper gates.

I also call your attention to the fact that certain parties have taken some steps to further interfere with the water-rights in Provo River by surveying lakes for reservoirs at the head-waters of the River, and I respectfully recommend that steps be taken at once to protect the accrued right you possess.

Yours Respectfully,
J. E. Booth,
Water Commissioner for the
year 1895.

195

Provo City, Utah, Nov. 16,1897.

Report of water measurements for Provo City 1897.

July 2nd River measurements showed 15,568 cubic feet per minute.

July 3rd City weirs showed 4,519 a shortage of over 2000 feet the weirs were not in proper shape for a correct measurement. The nest few days were spent putting them in good shape and on July 9th according to a mutual understanding we took further measurements. The River showing 13,721 cubic feet per minute.

July 10 the city weirs and water works showed 5063 cubic feet per min. A shortage of 8,37 feet in afternoon went to mouth of Canyon with Commissioner Booth and Will Johnson had trouble with James A. Loveless failed to turn any off of Provo Bench Canal, turned some from Timpanogos and upper East Union.

July 11 being Sunday went to mouth of Canyon with James Markman, Pulled a sufficient amount of Provo Bench canal dam out to make up our shortage. James A. Loveless appeared soon after but all was over and he did not molest our water.

The City weirs and waterwork showing the morning of July 12 6,210. A surplus of 310 feet per minute for the next 10 days the water was very irregular on account of the Provo Bench people tightening their dam and some unknown parties breaking ours, until,

July 20 when the commissioner with several others took measurements and found 12,652 cubic feet in the River. The City weirs and waterworks showed 5,072 cubic feet a shortage of 342 feet July 21 in connection with James Markman went to River bed near the waterworks and turned into City Creek 400 feet as measured later by commissioner Booth, giving Provo City her proportion again, which continued quite regularly until about July 27 when it began to decrease and on July 30 took the Commissioner and made further measurements finding 12,286 cubic feet in river, Provo Bench canal with some others had more than their share. We turned water from the Provo Bench Canal Park Ditch, Roberts' ditch and the Upper East Union Canal and on July 31 the City weirs and waterworks showed 5,770 cubic feet, giving Provo City 488 feet more than 43/100 of

196

river which is Provo City's proportion. On August 1st the Provo Bench Canal people replaced their dam under protest of Will Johnson who was there in the interest of Provo City, the same evening myself, James Markman, Wallace Conover, Joseph Meldrum and Wm. Johnson went to A. B. Walker and others whose names I did not know there and after considerable trouble succeeded in tearing out the dam they had placed there, and entered into an agreement with A. B. Walker watermaster of Provo Bench Canal to let the water alone until Monday Aug. 2nd when we made further measurements finding 11,682 cubic feet per minute in river.

August 4th another measurement was made finding 12,807 cubic feet in River. The City weirs and waterworks on same day showed 5,888 cubic feet or 381 cubic feet more than 43/100 of River. We accounted for this overplus at this measurement. Because the Timpanogos Canal was broken giving their water all to City Creek.

There was but little change until Aug 28th when I met A. B. Walker watermaster of Provo Bench Canal at the mouth of Canyon according to appointment when he called off the agreement entered into Aug 1st and next day they tightened their dam. We went immediately and tore it out which was kept up alternately nearly every day until about sept 5 when the River began to increase and contensions for the water practically ceased.

William J. Taylor.
Watermaster Provo City.

(Copy of record of A.L.Booth., Commissioner for 1897.)

Minutes of a meeting of the representives of the parties interested in the waters of Provo River held July 1,1897, at Provo City, Utah, at the call of Thomas Beesely chairman of the committee on irrigation of the Provo City Counsil, asking the representives of the several irrigation companies and persons owning water interested in Provo River to meet. The following named parties were present in the following capacities:

Thomas Beesely, Myron Tanner, and Myron C.Newell, committee on irrigation and William J.Taylor Watermaster of Provo City. James A.Loveless president Provo Bench Canal Co. John G.Jones, president Upper East Union. John E.Booth, president West Union Canal Co.. J.H.Clinger, Vice-president Lake Bottom Canal Co.. Fred Ferguson from Provo River Bottoms.

Meeting was called to order by Thomas Beesely. Myron Tanner was elected chairman and J.E.Booth secretary. On account of several parties and interest not being represented the meeting took a recess to 11 a.m. 11 a.m. Meeting resumed, A.B.Walker and P.M.Wentz of Provo Bench came in. J.A.Loveless placed in nomination for commissioner to measure and distribute the waters of Provo River Earnest D.Partridge; Myron C.Newell placed in nomination A.L.Booth for the same position. A.L.Booth recieved a majority of the votes, and on motion of J.A.Loveless A.L.Booth was elected unanimously.

On motion of Thomas Beesely the commissioner was instructed to measure and distribute the waters of Provo River in accordance with the facts and figures agreed upon as shown by the City Records of Provo City January 14,1884. The vote was unamimous in favor except the Provo Bench Co. voted no.

On motion of J.A.Loveless the chairman of the committee on irrigation was instructed to notify the commissioner that he should prepare and submit to an adjourned meeting to be called by said chairman a report for the year, carried.

On motion of M.C.Newell the expense of said commissioner be paid by the parties in interest in proportion to the waters claimed and distributed under said agreement of January 1884.

The Commissioner was instructed to meet with the several Superintendants for distribution of water on Friday July 2,1897, at 11 a.m at the mouth of the canyon. The meeting adjourned till Saturday July 3, at 1 p.m.

J.E.Booth.

Copied by A.L.Booth from the original minutes.

(Copy of record of A.L Booth, continued.)

Proportion of River to be distributed to the several parties.

Provo City:	East Union 1/10	0.1000	
	City Race 2/25	0.0800	
	Factory Race 3/20	0.1500	
	Tanner Race 1/10	0.1000	) 0.4300
Provo Bench Canal Co.	1/8		0.1250
West Union Canal Co	2/15		0.1333 1/3
Lake Bottom Canal Co.	1/15		0.0666 2/3
Timpanogus	1/50		0.0200
Upper East Union	1/12 & 200 cubic feet per minute		0.0833 1/3
Little Dry Creek	1/20		0.0500
River Bottom parties			0.0716 2/3
			1.0000

The 200 cu ft per minute for the Faucett Field belongs in with the U.E.U. 1/12

Roberts claims 100 ft. per minute but is not entitled to that much in low water. It is a part of River Bottoms.

Park owns none except by sufferance. It belongs to River Bottoms. McCullough is the same.

Carters 200 ft. is run down the West Union Canal, and comes out of the River Bottom.

(Copy of Record of A.L.Booth, continued.)

In accordance with the instructions of the meeting appointing Friday July 2, as the time for the commissioner to measure and distribute the waters of Provo River. A.L.Booth, said commissioner proceeded to the mouth of Provo Canyon and there met the following

W.D.Lewis and S.Carter for the West Union Canal Co.
I.B.Lott Faucett Field.
Fred Ferguson for River Bottom Parties
A.B.Walker, Provo Bench Canal & Irrigation Co.
W.J. Taylor Provo City.
John G.Jones, Upper East Union
George Meldrum Jr. Timpanogus.

The amount in the river was estimated at 16900 cubic feet per minute, and that proportion would give the following amounts.

Provo City	7267	Cubic feet
Provo Bench C.&.I.Co.	2112	" "
West Union	2253	" "
Lake Bottom	1126.7	
Timpanogus	338	
Upper E. U.	1407.3	
Little Dry Creek	845	
River Bottom	1551	
	1690000	

July 2

The measurements made showed the following amounts

City Stream (Including River Bottom & L.D.C.)	4329	Cu ft
" " Waste at weir and waterworks (estimated)	1500	" "
Provo Bench Canal	3199	" "
West Union	1970	" "
Lake Bottom (Estimated)	1126	" "
Timpanogus	886	" "
Upper East Union	2008	" "
Roberts 150 Park 400	550	
	15568	

This showed that the estimate in the river was too large. A partial adjustment was made and an apportionment was fixed to measure and distribute the water on Friday July 9,1897. When the weirs would be put in those ditches where they are not now, and others repaired which are defective.

Saturday July 3, In company with W.J.Taylor City Watermaster, Nels Johnson, and James Markham the city waters were measured and found to be as follows.

1/10	In the East Union Ditch	1175.28
2/25	City Race	792
3/20	Factory Race	1195.08
1/10	Tanner Race	1357.53
		4519.89

(Copy of Record of A.L.Booth, continued.)

July 9th 1897. I measure the waters of the several canals, as follows, and in the presence of the persons named.

City	J.W.Taylor (Waterworks included)	5728
Provo B.C.&.I.Co.	T.J.Patten	2555
West Union	W.D.Lewis and S.Carter	1876
Timpanogus	George Meldrum Jr.	436
Upper E Union	I.B.Lott	1915
River Bed,	Fred Ferguson and P Boyce	913
S.K.Roberts Ditch		145
David Parks Ditch and D.Park		153
Total		13721

All of these were weir measurements except the water in the river bed which was calculated by measureing the depth at distances of from 1 to 2 feet on the bottom, and timeing the flow by floats: and the S.K.Roberts ditch which was calculated where it runs in a flume across the waste ditch of the P.B.C.&.I Company.

July 10 1897 with W.J.Taylor and Nels Johnson I measure the City water at the vardous weirs and found the following amounts

Factory Race	1374.48
East Union	976.91
City Race	873.60
Tanner Race	738.15
Little Dry Creek (Est)	600.00
	4563.14

Showing with the 500 feet estimated for the waterworks a decrease of 665 from the measurement yesterday in bulk. This was accounted for by the streams being taken out along the river Bottoms.

Inbthe afternoon of July 10,1897 in company with W.J.Taylor and Nels Johnson I went to the mouth of the canyon and there found I.B. Lott and S.Carter. The intention was to take from those who had too much and give to those who were lacking. James A.Loveless on behalf of the Provo B.C.& I.Co. came a few minutes later and forbade any and every one to touch the dam placed in the river by that company. The measurements yesterday showed 2555 feet in the canal. The entire amount in all the streams was 13721 feet per minute, 1/8 of that, the proportion I had been informed belonged to the Provo Bench Canal & Irrigation Comapny would give 1715 as their share. I had also been informed that the Lake Bottom Canal obtained its water from springs below, and that it had a sufficient supply,and as there was no representive of that canal present I also divided the 1/15 or 915 feet proportionately among the canals taken out above, 1/8 of this would give 114 feet which added to the amount before mentioned makes 1829 feet to be given to the Provo Bench Canal & Irrigation Company. That canal had 726 more than the 1/8,and we went to the dam to turn some of the surplus down the river. Mr. Loveless said he was there ready to fight, to prevent one particle of the water from being turned out of his companys canal-- that if it were done it must be after he was crippled, and that the first man who took a rock from the dam would get hurt. Now I had not, so far as I could learn from the minutes of the meeting which appointed me commissioner, been constituted an officer to cripple anyone, nor did I understand it to be one of my duties to get hurt by being the first one to start removing a portion of the dam, and I was not quite prepared even to indulge in a fair fight on account of the difficulty. I therefore informed the parties that some 700 feet per minute more than 1/8 of the river was going the canal of the company which Mr. Loveless represented,and if they desired it they must tear out the obstruction themselves. All seemed t to think they did not want to risk personal injuries and when no one would make a move I considered my duty at an end for the immediate present. Thus did one man thwart the purposes of five others.

(Copy of record of A.L.Booth, continued)

We went down and turned some out of the timpanogus,until a measurement showed that there therein 319 feet or about 90 feet more than 1/50 of the amount. Mr. George Meldrum was present at the measurement. We also turned from the Upper East Union until the measurement showed 1477 feet 1/12 of the river & 1/12 of 915 would have given 1229 feet, but as there had been some contention regarding 200 feet claimed by the Faucett Field I left that amount in the Upper East Union Canal, and there was also some 48 feet above the 1/12 as explained above. We took no measurement of the increase of the city supply, as we knew there could not be enough to make up therir deficiency as shown yesterday.

July 20,1897.

Went and measured the river and found the following amounts, the persons named being present.

Provo Bench Canal		2188.92	feet per	minute.
West Union Canal		1969.00	" "	"
D.Parks Ditch		191.66	" "	"
River Bed		728.00	" "	"
City and Waterworks,	J.W.Taylor and James Markham	5149.40	" "	"
Upper East Union		1518.48	" "	"
Timpanogus	George Meldrum Jr.	357.12	" "	"
Lake Bottom Canal	At Dugway, Geo Scott, Geo. I.Taylor		" "	"
Lake Bottom Canal	at Meadgate (240)			
S.K.Roberts Ditch		150.00	" "	"
		12652.58		

The River Bed and Lake Bottom Canal measurements were made without weirs by measureing the depth of the water at distances of 2 feet, and the flow was obtained by timing a floating objectx at different parts of the stream.
The proper portion of the river on the basis obtained would give:

Provo Bench Canal	1/8	1581	ft per min.
West Union Canal	2/15	1687	" " "
River Bed or Bottoms	0.0919	1162	" " "
City Ditch & Waterworks	0.43	5440	" " "
Upper East Union Canal	1/12	1054	" " "
Timpanogus Canal	1/50	253	" " "
Lake Bottom Canal	1/15	843	" " "
Little Dry Creek	1/20	632	" " "
		12652	" " "

I could not get no defininte information as to where the portion for what is known as the Faucett Field should come from. One set of parties claimed it should be taken from the 1/12 turned into the Upper East Union Canal, and others interested in the latter denied the statement. I allowed 200 feet extra to go down the Upper East Union Canal on this account, and it left Provo City or some of the River Bottom Parties, or Little Dry Creek short, but which ones I could not ascertain, on account of the water for all these being measured at the xxxxxxxx one weir. We took some from the Provo Bench Canal, some from D.Parks ditch, and some from the West Union Canal, and a second measurement showed.

Provo Bench Canal	2032
West Union Canal	1864

We also turned some from the Timpanogus but the exact amount was not ascertained. The most of the increase obtained was sent down the river bed for the benifit of the Lake Bottom Canal.

During the day I also measured the four canals of the city and found in them

East Union	1388.59 Cu ft min
City Race	733.44 " " "

(Copy of record of A.L.Booth, Continued.)

Factory Race	1624.26	Cu ft. min.
Tanner Race	825.84	" " "
Little Dry Creek (Estimated)	650.00	
	5222113	
Waterworks (Estimated	500	
	5722.13	

Showing an increase of 572 feet from the measurements at the weirs, and leaving the city still short 342 feet of having its 43/100.

July 30,1897. Went and measured the water of the river there being p present W.J.Taylor, Nels Johnson, George Meldrum Jr. W.D.Lewis, I.B.Lott, Samuel Carter, and James Markham and George I Taylor a portion of the time.
Found the following amounts

City Creek	4276.65	cu ft per min
Provo Bench Canal	2188.92	
West Union Canal	1917.12	
D.Parks Ditch	249.50	
River Bed	1260.00	
Upper East Union	1358.00	
S.K.Roberts Ditch	150.00	
Timpanogus	346.40	
Waterworks (Estimated	500.00	
	12286.59	

On account of there being no weir in the Lake Bottom Canal no measurement was taken of the water in it. On the basis heretofore mentioned the canals would be entitled to the following.

Provo City 0.43	5288
Provo Bench Canal 1/8	1535
West Union 2/15	1638
Upper East Union 1/12	1024
Timpanogus 1/50	246
Lake Bottom 1/15	819
Little Dry Creek 1/20	614
Rivver Bottom .0919	1129
	12288

We turned some from the Provo Bench Canal, some from Roberts ditch, and Parks Ditch, some from the Upper East Union and some from the Timpanogus, and took the measurements as follows

Provo Bench Canal	1817.00
West Union	1758.72
City Creek	4848.90
Upper East Union	1223.00
Timpanogus	292.32
Roberts Ditch	109.00
Parks Ditch	115.00
River Bed (Estimated same as in morning	1260.00
Waterworks	500.00
	11923.94

Showing a difference of 362.65 from the measurement in the morning, we left the ditches in that condition, with instructions to the West Union to take some from the river bed to make up the portion belonging to that company, there being also 200 feet of Carters water taken down the West Union Canal. 200 feet of Faucett field water was left in the Upper East Union Canal.

(Copy of Record Of A.L.Booth, continued.)

August 2,1897.

Measured the waters of Provo River and found the following results.

Provo Bench Canal	1817.72
West Union	1864.32
City Creek	4575.15
Upper East Union	1319.04
River Bed	840.00
Timpanogus	248.64
Waterworks (Estimated)	500.00
Parks Ditch	108.04
Roberts Ditch	109.00
	11681.91

There were in the neighborhood J.W.Taylor, Nels Johnson, James Markham, M.C.Newell, Thomas Beesely, Joseph Meldrum, Ray Jones, and one or two others whose names I did not learn, from Provo City: James A. Loveless, T.J.Patten, A.B.Walker, and three others from Provo Bench, I.B.Lott and J.G.Jones from the Faucett Field and Upper East Union. None of these were present when the measurements wer taken except J.W.Taylor, I.B.Lott, and J.G.Jones, the first of whom saw the city, the River Bed, the Upper East Union, and the Timpanogus measured, and the others xxxxxxx two saw City Creek and the Upper East Union. The amount would give the following proportions

City .43	5023	
Provo Bench 1/8	1460.00	
West Union 2/15	1557.00	
Upper East Union 1/12	973.00	
River Bottom .0919	1073.00	
Timpanogus 1/50	233.00	
Lake Bottoms 1/15	778.00	
Little Dry Creek 1/20		
	11681.00	

Informed the parties present of the result but nothing was done as to regulating the quantities by taking from some and giving to others.

August 4,1897.
Went in company with J.W.Taylor and measured the following.

Lake Bottom Canal	720.00	cu ft min.
West Union Canal	1837.44	
Parks Ditch	166.50	
Provo Bench Canal	1970.84	
Roberts Ditch	77.28	
City Weir	5302.50	
Stream running into city creek below weir	399.00	
Waterworks (Estimated)	500.00	
Upper East Union	1287.36	
River Bed	555.00	
Timpanogus empty on account of Break in canal		
	12815.92	

(Copy of Record of A.L.Booth, concluded.)

I also measured the water coming into the city and found the following amounts

Factory Race	2150.00
East Union	1657.57
City Race	602,88
Tanner Race	977.00
Little Dry Creek	528.00
	5915.39
Citys Portion	5387.39
Waterworks	500.00
	5887.39

As there was 5302.50 ft coming through the city weir and in the stream below 399 ft. and the waterworks Estimated 500 ft total 6201.50 and as we found on the lower measurement 5915.39 & 500 for waterworks total 6415.39 It showed a difference of 213.89 ft in favor of the lower measurements, and would make in the river altogether 13029.81 and the various canals would take the following amounts on the basis of the agreement of 1884

City 0.43	5602 plus
Provo Bench 1/8	1626 plus
West Union 2/15	1787 "
Upper East Union 1/12 ~~x~~ & 200	1085 "
Little Dry Creek 1/20	651 "
Lake Bottom Canal 1/15	868 "
Timpanogus 1/50	260 "
River Bottom .0919	1197 "
	~~13202x28~~
	13028

We did not make any changes on account of the parties not being present and also on account of the Timpanogus being empty through breaking.
Provo City had 285 ft too much
Provo Bench " 340 " " "
West Union " 100 feet too little allowing 200 feet for carters in that Ditch.
East Union had 2 feet too much allowing 200 ft for Faucett Field
Little Dry Creek had 123 ft too little.
Lake Bottom Canal Had 148 " " "
Timpanogus had 260 " " "
And River Bottom had 6 " " "

(Note: The foregoing concludes the records of measurements for the season of 1897. On the page following above is expense and salary account, and a copy of minutes of representives of companies held Nov.24,1897, in which the commissioners report was presented and accepted. T.F.W.)

Provo City, Utah,
Dec. 19th, 1898.

To The various representatives of water interests in Provo River:

Gentlemen :-

The undersigned begs leave to make the following report of his labors as water commission for the year 1898, under the appointment that was given him by you in June of the present year:

On June 15th, in company with W.K.Farrer, City Water master of Provo City, Samuel Carter, of the West Union Co. and Wm. S.Roylance I took what was desired to be a "High water measurement" for the purpose of ascertaining the full capacity of the various canals and found as follows:

Factory Race	3226.44 cu. ft.
" " 2nd measurement	3854.88
City Race	1042.56
East Union	1217.61
Tanner's Race	1306.47
Lake Bottom Canal	1092.00
West Union "	2589.12
Provo Bench Canal	4312.80
Upper East Union	1437.84
Park's ditch	528.12
Robert's Ditch	190.00

Timpanogos Canal not measured owing to a break in the ditch. This measurement was not entirely satisfactory for a high water measurement, as the river had fallen so as to make it impossible to get the full amount out into the ditches; It should have been taken a week or ten days earlier. Park's ditch was the only one that had all it could carry.

A measurement of the Provo Bench Canal on June 22 showed 3485.20 cubic feet per minute, over 1100 feet more than a week before, Theodore Farley, James A. Loveless, A. B. Walker, S. Carter and W. K. Farrer were present.

June 30 in company with W. K. Farrer, John N. Strong, E. Martin and A. B. Walker I measured the water and found in

Factory Race	2604.06 cu. ft. min.
East Union	755.30
City Race	566.40
Tanner's Race (Float measurement)	1276.00
Little Dry Creek	700.00
West Union	1917.12
Park's Ditch	558.56
Provo Bench	2988.16
Upper East Union	2030.40
Timpanogos (Float measurement)	889.00
Lake Bottom	367.78

July 7,: Present part or all of the time: W. K. Farrer, S. Carter A. B. Walker, John Strong, W. N. Scott, S. K. Roberts, D. Park and R. Boardman:

Measurements showed in

Provo Bench	2188.92 cu. ft. min.
West Union	1758.72
Park's Ditch	297.00
Roberts' ditch	60.49
City Creek	2935.12

200

Upper East Union	1897.92
Timpanogos	413.00

On this occasion water was turned into City from various flows and a second measurement showed in

Provo Bench	1879.20 cu. ft. min.
West Union	1706.88
Park's ditch	149.76
Upper East Union	1242.72
City Creek	3581.76

July 9th water coming into Provo City was:

Little Dry Creek (estimated)	300.00
Factory Race	1687.74
East Union	901.38
Tanner's Race	654.90
City Race	696.00
Lake Bottom	319.50

July 21: Present A. B. Walker, Roger Farrer, John N. Strong, Geo: Meldrum, Jr., S. D. Roberts, John Stubbs, Fred Ferguson, S. Carter and Robert:Boardman:
The measurements showed in

Provo Bench	1474.36
West Union	1408.32
Park's Ditch	110.52
Roberts' ditch	60.49
City Creek	3581.76
Upper East Union	1242.72
Timpanogos	235.90
Roberts' ditch No. 2	29.92

Changes were made so that a second measurement showed, in

City Creek	3950.24
Upper East Union	1204.56

The water coming into the City was later measured and there was in

Factory Race (Float measurement)	1530.00
Tanner's Race	804.75
City Race	752.64
East Union	826.68
Little Dry Creek, (estimated)	300.00
Lake Bottom	228.62

July 22nd

City Creek	4025.28
Timpanogos	291.20

Streams taken out of City Creek by Stubbs, Ferguson, Boyce, et al.

Island Creek	307.98
Ferguson Ditch	203.00
Will Ferguson's little ditch	36.57

August 8, Present A. B. Walker, S. Carter, R. Board and W.H.Farrer:

Lake Bottom	319.50
West Union	1681.92
Park's ditch	149.64
Provo Bench	~~88.09~~ 1338.64
Roberts' ditch	45.98
" " No. 2	2885.12
City Creek	932.40
Upper East Union	268.10

Timpanogos	268.10
Tanner's Race	425.13
Factory Race	1624.26
East Union	1015.09
City Race	367.68
Little Dry Creek (estimated)	250.00

August 11

Measured Factory Race and found at weir - 1166.10 ft. min.
running in below weir (estimated) 100.00

1266.10

August 20,

Present J. A. Loveless, P. M. Wentz, A. B. Walker, S. Carter and W. K. Farrer.

Factory Race	1195.08 cu. ft. min.
East Union	826.68
City Race	549.12
Tanner's Race	654.90
Little Dry Creek	500.00
Lake Bottom	445.00
West Union	1289.28
" " 2nd measurement	1408.52
Park's ditch	198.32
Roberts' ditch No. 1	88.09
" " " 2	32.34
Provo Bench	1104.32
City Creek	2918.72
Upper East Uniont	915.12
Timpanogos	128.10

At all the times of measurement the city should be credited with the amount in the waterworks, estimated at 50 cu. ft. per minute. It will be seen that the water has not been divided strictly on the basis of the 1884 agreement, but there was less difficulty this year than last year, and generally a feeling was manifest among the parties interested to do the best they could for all the others; especially was this the case during the very scarce period of the season; the water generally was much lower in 1898 than in 1897.

The difficulty to which I referred in my last year's report in relation to the question as to where the water for the Fausett Field should come from has not been settled; neither has that relating to those who comprise the River Bottom parties - some taking the stand that only the parties on the east side of the river are included in this class, and other maintaining that all who do not belong to some canal Company are the ones that should be reckoned among the River Bottom parties.

The weirs are not in such a good condition as they should be; The one placed in the Lake Bottom Canal at the foot of the Provo Dugway has the best situation of any, and if all could be fixed so as to give as much still water as that one does the results would no doubt be more satisfactory to all parties concerned in these measurements: It transpired however with relation to the Lake Bottom Canal weir that in the latter part of the season it did not give a correct measurement on account of the large amount of seepage that comes in below the place of measurement; during the early season this is not so much the case.

I respectfully suggest that before another irrigation season commences an amicable settlement of the questions now pending be brought about, so that the commissioner appointed in future shall know what he is to do and can have the full power to carry out the terms of whatever agreement may be arrived at.

202

Respectfully submitted,

Alfred L. Booth Commissioner

Provo,Utah,Nov.9,1918.

Provo Reservoir Company.

Provo,Utah.

Gentlemen:

In reply to your verbal request for the amounts of water diverted from the Olmstead flume to supply your canal during the past season,I submit the following ;

August 4, 12. c.f.s reduced to 2. c.f.s.
August 7, 2. c.f.s.
August 16, raised to 7. c.fs. on account increased storage.
August 24, reduced to 4. c.f.s.

Provo Reservoir Company Storage and Tunnel Water on above Dates;

Aug. 4, 33.00 c.f.s.
Aug. 7, 33.00 c.f.s.
Aug. 16, 20.00 c.f.s
Aug. 18, 23.00 c.f.s
Aug. 24, 23.00 c.f.s.
Provo Reservoir Co. Blue Cliff Water; and
Provo Reservoir Co. Wright Estate Water, and John D.Dixon Wright of 2.50 c.f.s. an award of 7.50 c.fs. the following is proportion of canyon flow they recieved;

	Total	Blue Cliff.	Wright & Dixon.
Aug. 4,	40.3 c.f.s.	35.00	5.3
Aug. 7,	41.67 c.f.s.	36.24	5.43
Aug. 16,	40.3 c.f.s.	35.00	5.30
Aug. 24,	36.8 c.f.s.	32.00	4.80

(Dates not on observations are calculated from discharge at Gageing Station.)

Resp. Submitted,

T. F. Wentz

Commissioner.

UTAH POWER & LIGHT COMPANY

KEARNS BUILDING

SALT LAKE CITY, UTAH

November 1, 1918.

Mr. T. F. Wentz, Water Commissioner,
Provo, Utah.

Dear Sir:

I have instructed Mr. Ripka to make a negative for you from our map UD-8757. This negative will replace the one damaged in an express shipment recently sent you. You are at liberty to use this negative to prepare prints for inclusion in your reports, as you recently requested.

Yours very truly,

MARKHAM CHEEVER, GEN'L SUPT. & CHIEF ENGINEER

HLS-H

BY - H. L. Stoner

Provo,Utah, Nov.5,1918.

Utah Power & Light Co.

Salt Lake City, Utah.

Gentlemen;

I have your favor of the 1st. inst., and I am very grateful for your courtesy. I am making all haste possible to have report ready for next session of Court.

On account of limited time the Unit map of the Provo System has been a great help. I am sure the Court as well as myself will appreciate your attitude in this matter.

Yours Very Truly,

T. Howard

Commissioner.

28/a

RESPONSE FOR REQUEST FOR DATA.

Provo,Utah, Nov.18,1918.

Provo Reservoir Company.

Provo,Utah.

Gentlemen:

Complying with your request over telephone,of this date, for the quantities of water available in Provo Canyon for use of Provo Reservoir Company and Timpanogus Canal Company of waters arising in the Canyon Below the diversion dam of the Utah Power & Light Co. and waters that pass through and beneath the said dam,and also the quantity of water that has been diverted over the U.P.&.L.CO. dam and from flume to supplement the quantities to Provo Reservoir Canal and Timpanogus Canal. I submit an abstract of records.

Following this letter is copy of notes relative to information desired:

Resp.

D. F. Watt

Commissioner.

July 7,1913: Provo Reservoir Canal 75.cfs.
July 8,1913: Provo Reservoir Canal cut from 65.cfs. to 45.cfs.
July 11,1913 Provo Reservoir Canal 46 cfs.
Timpanogus Canal 13.60.
July 12,1913 Provo Reservoir Canal 44.51 cfs.
July 13,1913 " " " 49.02 cfs.
July 17,1913 " " " 44.66 cfs.
July 23,1913 " " " 54.84 cfs.
July 30,1913 " " " 55.43 cfs.

Aug.1,1913 Provo Reservoir Canal 47.00 cfs.,
Timpanogus Normal.
I arrange with Utah Power & L.Co. to turn 5 cfs. over dam.

Aug. 7,1913: Timpanogus Canal 6.43 cfs. gate has been dislodged.
~~Aug xx 5, 1913~~ Provo Reservoir Canal 49.50 cfs.
Aug. 8,1913. Timpanogus canal 8.92 cfs.
Aug. 20,1913. Provo Reservoir Canal 47.cfs. Plus.
Aug. 27,1913. Timpanogus Canal 7.99 cfs.,drift in gates removed.
Aug. 25,1913 Provo Reservoir Canal 47 cfs. Plus.

December 4,1913. Provo River at Donnon's Resort, about one-half mile below U.P.&.L.Co. Dam 74.36 c.f.s.
Provo River at Heiselt Bridge 78.29 c.f.s.
Provo River at U.S.G.S. Station ~~222~~ 285 c.f.s.

****

July 8,1914: Provo Reservoir Canal 74. cfs.
Timpanogus Canal 29.00 c.fs.
July 18,1914: Provo Reservoir Canal 78.00 cfs.
Timpanogus Canal 20.76 cfs.
July 19,1914: Provo Reservoir Canal 69.30 cfs.
Timpanogys Canal 18.40 cfs.
July 22,1914: Provo Reservoir Canal 69.00 cfs.
Timpanogus Canal 17.80 cfs.
On July 20,1914,I turned down the river,past the Wasatch and Midway Dams 15 cfs. of tunnel and reservoir water for the Provo Reservoir Comapny,Since the highwater and until this date the Upper Midway Dam has been tight.

2810

July 10,1915: Provo Reservoir Canal 33.00 cfs.
Timpanogus Canal 10.80 cfs.
I raise gates of Timpanogus and ask Mr. Condor of U.P.&L.Co. to have turned over dam 4 cfs. to bring up Timpanogus.

July 12,1915: Provo Reservoir Canal 29.78 cfs.
Timpanogus Canal 11.60 cfs.
4:20 p.m. Condor reports 6 inches over weir at gate house = 6.95 cfs.

July 15,1915: Provo Reservoir Canal 34.92 cfs.
Timpanogus Canal 12.70 cfs.

July 20,1915: U.P.&.L Flume at Donnons Stat. 9:10 a.m. 4.82 gage H. 5.85 cfs. over U.P.&.LCo. Dam,at 9:25 a.m. turned this amount into flume,at 9:40 a.am. gage at Donnons stat. reads 4.85.

July 21,1915: At 6;45 am. ask U.P.&.L. to take 4 cfs more through flume.

July 22,1915: Provo Reservoir Canal 32.32 cfs.
Timpanogus Canal 12.70 cfs.

July 25,1915: Provo Reservoir Canal 31.50 cfs.
Timpanogus Canal 12.70 cfs.

July 26,1915: Provo Reservoir Canal 32.32 cfs.
Timpanogus Canal 12.70 cfs.

July 29,1915: Provo Reservoir Canal 24.74 cfs.
Timpanogus Canal 11.37 cfs.
At 6:30 p.m. called Mr. Fowler of U.P.& L. to turn 5 cfs. more over dam for Provo Reservoir Co. "We will turn it now."

July 31,1915: Provo Reservoir Canal 27. cfs. I phone Heiselt to turn in 2 cfs. more. I also phone U.P.&.L. to turn more water from flume to river.

Aug. 3,1915: Provo Reservoir Canal 35.02 cfs. About 6.cfs going over Timpanogus Dam. Go to U.P.&.L. Dam with Fowler, raise flume to G.H. at Donnons to 4.97 at 11:40 a.m.

Aug. 9,1915: Provo Reservoir Canal 31.20 cfs.
Timpanogus 11.60 cfs.

Aug. 11,1915: Provo Reservoir Canal 31.10 cfs.
Timpanogus Canal 12.04 cfs.

Aug.12,1915: Provo Reservoir Canal 30.10 cfs.
Advise Mr. Fowler ,Provo Reservoir Canal is 1.20 high.

Aug.15,1915: I phone Fowler of U.P.&.L. Co. to turn 5.cfs. more through flume in morning. Pratt phoned "Turned 5 cfs less from Reservoirs for Provo Reservoir Co."

Sept. 7,1915: Provo Reservoir Canal 16.87 cfs.
Timpanogus Canal 9.85 cfs.

Sept. 4,1915: I clear the Provo Reservoir Dam of top structure getting spill entire length of dam and lowering canal.

****

July 3,1916: Provo Reservoir Canal 102.69 cfs.
Timpanogus Canal 19.50 cfs.

July 5,1916 Provo Reservoir Canal 99.60 cfs.
Timpanogus Canal 18.79 cfs.

July 10,1916: Provo Reservoir Canal 89.75 cfs.
Timpanogus Canal 17.36 cfs.

July 25,1916 Provo Reservoir Canal 67.83 cfs.
Timpanogus Canal 15.53 cfs.

Aug.2,1916: Provo Reservoir Canal 69.17 cfs.
Timpanogus Canal 16.27 cfs.

Aug. 14,1916: Provo Reservoir Canal 70.49 cfs.
Timpanogus Canal 15.89 cfs.

Aug. 23,1916 Turned from Wasatch County to Utah County 37.cfs. Midway Dam has been tight to this date, since highwater.

Aug. 26,1916: Provo Reservoir Canal 74.80 cfs.
Timpanogus Canal 12.13 cfs.

Sept.8,1916: Provo Reservoir Canal 83.27 cfs.
Timpanogus Canal 14.00 cfs.

2810 Sept.9,1916: Olmstead Flume Donnons 198.93 cfs.
U.S.G.S.Station 302 cfs.

July 25,1914: Provo Reservoir Canal 64.13 cfs.
Timpanogus Canal 20.00 cfs.
July 27,1914: Olmstead Flume at Donnons Station 227.83 cfs.
Olmstead Flume at Nunns Station 236.74 cfs.
River at U.S.G.S.Station 316 cfs.
July 28,1914: Provo Reservoir Canal 61 cfs.
Timpanogus Canal 21.80 cfs.
River at U.S.G.S Station 316 cfs.

Aug. 1,1914: Provo Reservoir Canal 76.50 cfs.
Timpanogus Canal 21.20 cfs.
Aug.3,1914: Provo Reservoir Canal 77.00 cfs.
Timpanogus Canal 20.40 cfs.
Aug. 6,1914: Provo Reservoir Canal 66.50 cfs.
Timpanogus Canal 18.00 cfs.
Aug.11,1914: Provo Reservoir Canal 66.50 cfs.
Timpanogus Canal 16.20 cfs.
Aug.12,1914; Provo Reservoir Canal 60.00 cfs.
Timpanogus Canal 18.00 cfs.
Aug.15,1914: Provo Reservoir Canal 54.50 cfs.
Timpanogus Canal 18.00 cfs.
Aug.19,1914: Provo Reservoir Canal 60.20 cfs.
Timpanogus Canal 16.40 cfs.
Aug.25,1914: Provo Reservoir Canal 64.75 cfs.
Timpanogus Canal 15.96 cfs.
Sept.1,1914: Provo Reservoir Canal 63.00 cfs.
Timpanogus Canal 17.40 cfs.
Sept.7,1914: Provo Reservoir Canal 41.17 cfs.
Timpanogus Canal 17.40 cfs.
Sept.10,1914: Provo Reservoir Canal 42.22 cfs.
Timpanogus 16. cfs.
Sept.12,1914: Provo Reservoir Canal 41.54 cfs.
Timpanogus Canal 15.39 cfs.

1914: No record of quantity of water passing Timpanogus Dam,and no record of any water being diverted over U.P.&.L.Co. dam or from Olmstead Flume.

Oct.19,1914: Olmstead Flume at Donnons 207.92 cfs.
U.S.G.S.Station 368 cfs.
Nov. 6,1914: Olmstead Flume at Donnons 212.06 cfs.
U.S.G.S.Station 324 cfs.
Nov. 9,1914: Olmstead Flume 220.33 cfs. (Donnons Station)
U.S.G.S.Station 324 cfs.

****

July 2,1915: Provo Reservoir Canal 30.78 cfs.
Timpanogus Canal 11.87 cfs.
July 7,1915: Provo Reservoir Canal 29.78.
At 10 a.m. ask U.P.& L.Co. to turn 5 cfs. additional by dam.In going to head of Provo Reservoir canal I notice small flow over U.P.&.L spillway-- the Timpanogus with no spill over dam,if this amount of water is taken over dam Timpanogus will be short I therefore call U.P.&.L from heislets and ask for 8-10 cfs. over dam. Go to dam about 12-14 cfs by dam. Return to Olmstead,talk over phone with Brundige and explain situation. expect answer in 15-20 minutes. Answer " Will turn the amount"
P.M. Go to dam,with Mr. Lusenberry turn over U.P.&.L 6 ft. waste gate 7 inches of water,approx 9 cfs.
July 8,1915: Provo Reservoir Canal 36.99 cfs.
Timpanogus Canal 11.80 cfs.
July 9,1915: Provo Reservoir Canal 37.95 cfs.
Timpanogus Canal 12.00 cfs.
Through Timpanogus Dam 0.25 cfs.
Leakage at Nunns from Olmstead flume 0.50 cfs.
Olmstead flume Donnons 224.64 cfs.

28/C

1916: No record of water from Olmstead flume or over Timpogus Dam.

Sept.22,1916: Provo Reservoir Canal 81.47 cfs.
Timpanogus Canal 14.32 cfs.
Oct. 9,1916: Olmstead flume at Donnons 218.76 cfs.
U.S.G.S.Station 425 cfs.

****

July 16,1917: Provo Reservoir Canal 118 cfs.
Timpanogus Canal 22.57 cfs.
July 19,1917: Provo Reservoir Canal 116.50 cfs.
Timpanogus Canal 21.50 cfs.
July 23,1917: Provo Reservoir Canal 88.16 cfs.
Timpanogus Canal 16.87 cfs.
July 26,1917: Provo Reservoir Canal 90.00 cfs.
Timpanogus Canal 17.10 cfs.
July 30:1917: At 12 p.m. Midnight Utahp Power & Light turned out of flume for instalation of new structure. No water in balance of season.

****

June 28,1918: Provo Reservoir Canal 51.84 cfs.
Timpanogus Canal Co. 13.20 cfs.
Olmstead Flume at Donnons 228.96 cfs.
June 29,1918: Provo Reservoir Canal 33. cfs.
Timpanogus Canal 13.20 cfs.
I request U.P.&.L. to turn 20cfs by dam. I raise gate at sandbox 8½ inches,this is agreeable to U.P.&.L. for temporary arrangement.
Provo Reservoir canal,7:12pm. 57. cfs. I meet Oliver (of U.P.&.L.CO.) at Olmstead and authorize hime to close sand gate 2 inches.
June 30,1918: Provo Reservoir Canal 54.10 cfs.
July 3, 1918: Provo Reservoir Canal 62.50 cfs.
I call Oliver and tell him to raise sandgate 4 inches.
July 4,1918. Provo Reservoir Canal 83.81 cfs.
July 6,1918: U.P.&.L.Co. turn out of flume approx. 14 cfs. of water.This is Factory Race Water to go through Provo Reservoir Canal for irrigation of grain as arranged by U.S. Food Administrator.
July 7,1918: "Mr Jones" is now in charge of Olmstead Plant,I request Jones to turn more water down to Provo Res. Canal.
At 1 p.m. Provo Reservoir Canal 88 cfs.
I call Jones he states"We did not turn water until 12M."
I advise him to get Provo Reservoir Canal up to 102.50 cfs. this p.m. if he can conveniently.
July 8,1918: Provo Reservoir Canal 94.95 cfs.
Timpanogus Canal 16.94 cfs.
Provo Reservoir canal at 10 p.m. 113. cfs.
I call Jones and tell him to take more water thru flume.
July 9,1918: Timpanogus Canal 16 cfs.
I talk to Jones he reports same load as yesterday morning. In our conversation we conclude that the bulk heading of flume caused the extra amount of water to flow out and to the Provo Reservoir Canal.
Provo Reservoir Canal 100.25 cfs. I request U.P.&.L.Co. to take more water thru flume and reduce Provo Reservoir Canal to stage of yesterday morning.
In company with Mr. Stoner go over part of system.
Provo Reservoir Canal, 12;05pm. 106.60 cfs.
At 12;20 pm. I tell Jones to take 15 cfs. more thru flume.
We stop at Nunns and request Mr. Carter (Employee of U.P.&.L.Co.) to take enough water into flume so that gage in river is the same as yesterday morning.

281 E,

July 9,1918: J.Edward Taylor of U.S Food Administration,phones "We have arranged to have use of the U.P.& L.Co. Ontario Tunnel Water through Provo Reservoir Canal, for grain irrigation." I reply I will get this in Canal tomorrow.

July 10,1918: I call Jones and tell him we will run Provo Reservoir Canal at G.H. 2.10. (104 cfs.)
Olmstead Flume at Nunns 171.64 cfs. Go to plant,on account of flume being bulkheaded it is impossible to make adjustment to-night by taking more water t rough U.P.&.L.Co.
Cut Provo Reservoir Canal by taking out plank in spillway. Raining.
Timpanogus Canal 13. cfs. at 6;20 a.m.

July 11,1918. Provo Reservoir Canal 10;22 a.m. 145.cfs.
Provo Reservoir Canal Entitled to 104.63*cfs. a g.h. of 2.13. River ~~z~~ is raising and muddy. I notify Jones to take more water through flume.Observe that at this stage Provo Reservoir Company are entitled to some class "d" water
* Class "A" right.
I call on Jones,he states we will have bulkheads out this afternoon and can then take more water.
7:40p.m. I call Jones he states: we put 20-30 cfs. more water in flume,expect to get more in when bulkheads are removed. At 8:10 p.m. Jones Calls"we:have taken all the water that has been going over spill at Nunns".

July 12,1918: Provo Reservoir Canal ~~xixx&&xxfxx~~ 113. cfs.
Timpanogus Canal 10.75 cfs.
By Timpanogus Dam 5. cfs.
Installed "Nunns River Gage". reads 68.

July 14,1918: Provo Reservoir Canal 136.50 cfs.
About 2.5 cfs. through Timpanogus Dam.
Timpanogus Canal 10.75 cfs. River is muddy and carrying large quantities of drift,U.P.&.L.Co. tailrace clear--probably Smith Ditch Broken or cloudburst in Pole Canyon.
Jones states " We are on usual load."

July 15,1918; Provo Reservoir Canal 130.44 cfs.
By Timpanogus Dam 3.00 cfs.
Timpanogus Canal 10.75 cfs.
U.P.&.L. Co. Olmstead Flume at Nunns 203.52 cfs.

July 18,1918: Provo Reservoir Canal 95.50 cfs.
Timpanogus Canal 13.10 cfs.
Talker with Oliver of U.P.&.L.Co. and instructed him to turn about 10 cfs. down to Provo Reservoir Canal.
Nunns River gage 2;46p 55. I call Oliver and again ask him to turn 10. cfs. to river. No water has been turned as requested this a.m.
In evening I phone McEwan of P.R.CO. he reports Provo Reservoir gage 224 (111.50) I request him to phone Oliver and have it cut to 2.13 g.h.

July 19,1918: Provo Reservoir Canal 4:41 p.m. 2.07 (102. cfs.)

July 20,1918: McEwan Reports G.H.Provo Reservoir Canal at 2.38
I call Oliver and tell him to close gate at Nunns, and take spill through flume,and until Monday run Nunns River gage at 64.

July 23,1918: Provo Reservoir Canal 95.18. cfs.
By Timpanogus Dam 6.86 cfs.
Olmstead Flume at Nunns 193.84 cfs.
Timpanogus Canal ~~xx~~ 13.10 cfs.
H.L.Stoner in company.

July 24,1918: 8:30 a.m. I call Chipman of Timpanogus Canal and order that Timpanogus Dam be made tight.
I call Oliver of U.P.&.L. and request him to raise water in flume to G.H. 5.90 at Nunns Station,I suggest it would be well to make this raise in two steps,one this morning and one this afternoon.
Under conditions it seems best to change Factory Race ~~xxxx~~ water from Provo Reservoir Canal to Provo City tonight. (nothing definite could be obtained on proposed change to other canals.)

281 F.

July 24,1918: Continued:
I call at Olmstead Plant, Oliver states " we have raised from 58 inches to 60 inches at gage below gatehouse.
I call at Dam,Richens (Gate Tender) states," we are full in this old flume."
At 8:20 p.m. Mr. Peay phones(Provo City Watermaster) phones "We cannot be ready for Factory Race water this week."
Factory Race Water returned July 24,1918, 10:00 a.m.

July 25,1918: Provo Reservoir Canal 5;36 a.m. 68.cfs.
At 8:10 a.m. I call Oliver of U.P.&.L. and request him to turn 5 cfs. over spillway for Provo Reservoir Co.
Provo Reservoir Canal 6;06p.m. 80.62 cfs.

July 26,1918: Provo Reservoir Canal 77.50 cfs.
Timpanogus Canal 13.10 cfs.
I call Oliver and tell him of 2.12 cfs. excess to Provo Reservoir Co. We think it best not to try to make this change as falling river will hit Provo Reservoir Canal.
Oliver states "We will keep flume at same point. I go to breakfast at 10.am.

July 27,1918: Olmstead flume at Nunns 11;31 a G.H.510.
Nunns River Gage 47.
Provo Reservoir Canal 73.50 cfs.
Timpanogus Canal 13.10 cfs.

July 28,1918: Observe that "concession" of U.P.&.L.Co. Ontario Tunnel water to U.S.Food Administrator through Provo Reservoir Canal expired last night.

July 29,1918: I have notified Timpanogus Canal Co. that all leakage through dam will be charged against them begining to-morrow.

July 30,1918: I have instructed McEwan to tighten dam,and to observe Timpanogus in the work on their dam so as not to cut Timpanogus out,but I desire to not have leakage passing Timpanogus dam.

July 31,1918: Provo Reservoir Canal 60.02 cfs.
Nunns River gage 40.
Olmstead Flume Nunns 180. cfs.
By Timpanogus Dam 1.75 cfs.
Timpanogus Canal 15.80 cfs.
At 7 p.m. I authorize Jacobs of Provo Reservoir Co. to increase flow in Provo Reservoir Canal to 63.83 cfs.

Aug.1,1918: Jacobs calls my attention to modification of decision and assignment of J.D.Dixon.

Aug.2,1918: By Timpanogus Dam 0.30 cfs.
Provo Reservoir Canal 64. cfs.
Timpanogus Canal 15.80 (No change and reads same before and after)

Aug. 4,1918: Provo Reservoir Canal 64.00 cfs.
About 2 cfs. spilling over Timpanogus Dam.
Timpanogus Canal 15. cfs.*
I have requested Oliver to take a little more water through flume by closing gate two notches.
Provo Reservoir Canal 7:10p.m. 57.60 cfs.
I request Oliver to raise gate one notch,and have requested McEwan to tighten dam to cut out spill over Timpanogus Dam.

Aug.6,1918: Provo Reservoir Canal 8:45pm. 77.50 cfs.
U.P.&.L.Co. load same.
Additional water to Provo Reservoir Canal caused by storms,Oliver reports no change of amount in flume,at present I am unable to account for extra water coming down river instead of flume unless control to flume is regulated by radial gate.

Aug.7,1918: Provo Reservoir Canal 65.16 cfs.
By Timpanogus Dam 0.30 cfs.
Olmstead flume Nunns 187.64 cfs.
Nunns River Gage 38.
Nunns Spill to river 2.cfs.
Timpanogus Canal 10.50 cfs.
Note: No.1 Bulkhead reduced to one plank July 15, 2:20 p.m. "Dusenberry".

281 G

Aug.15,1918: Provo Reservoir Canal 56.10 cfs.
By Timpanogus Dam 0.75 cfs.
Nunns River gage 34.
Olmstead flume at Nunns 180.29 cfs.
Timpanogus Canal 12.00 cfs.

Aug.16,1918: Provo Reservoir Canal 51.80 cfs.
I request Oliver to raise gate at Nunns spill "one notch" approx. 5 cfs. to river for Provo Res. Co.
Bridal Veil Falls to flume tomorrow.

Aug. 19,1918: Provo Reservoir Canal 56.50 cfs.

Aug.23,1918: Provo Reservoir Canal 54.38 cfs.
By Timpanogus Dam 1.25 cfs.
Nunns River Gage 33.
Olmstead Flume at Nunns 162.79 cfs.
Timpanogus Canal 12.64 cfs.

Aug.24,1918: I call at Olmstead and authorize Olive to take 3 cfs. more thru flume.

Aug. 27,1918: Provo Reservoir Canal 55.cfs.
By Timpanogus Dam 0.30 cfs.
Timpanogus Canal 10.70 cfs.

Sept.6,1918: Provo Reservoir Canal 55.77 cfs.
By Timpanogus Dam 1.00 cfs.
Nunns River Gage 37.
Olmstead flume at Nunns 165.26 cfs.
Timpanogus Canal 12.27 cfs.

Sept. 7,1918; Observe that storage is exhausted.
I call at Olmstead and request Oliver to cut off two-thirds of amount over Nunns Spillway, that is I expect to increase U.P.&.L. and decrease Provo Reservoir Co. by storage supply exhausted to-day.

Sept.9,1918: Provo Reservoir Canal 54.40 cfs. I adjust at mouth of cnayon to divide extra water through U.P.&.L.Co. tail-race.
I call on Oliver at Olmstead he states that change at Nunns Spillway was made this morning at 7 am. This is noticable on register record of Provo Bench Canal. You will observe drop has not reached Provo Reservoir Canal. I defer further adjustment until conditions are settled.
Provo Reservoir Canal at 6:52 pm. 50 cfs.

****

Abstract of record prior to 1913 not submitted on account ot time.

281 H

Provo,Utah, Dec. 20,1918.

O.J.Poulsen,
Secretary Provo Bench Canal And Irrigation Co.

Provo, Utah, Nov. 26, 1918.

Hon. C.W. Morse,

Special Judge Fourth District Court.

Salt Lake City, Utah.

Dear Sir:

I am sending you by American Express:
Volume, and Roll of Maps, Special report on Provo River.

You will observe report is not yet complete, the two additional plates will be forwarded as soon as completed, and the written material can be inserted at any time.

I think it would be advisable to return the report to reach me about Dec. 7, so I may finish indexing and compiling.

Resp.

T. F. Wentz

Subject:
Provo Reservoir Co.
Vs
Provo City et al
No.2888.

Provo City, Utah, Jan.24,1919.

Rawlins Ray & Rawlins.

Counsel Provo Bench Canal & Irrigation Co.

Salt Lake City, Utah.

Gentlemen:

In the case Provo Reservoir Company vs. Provo City et al. the Commissioner was ordered to submit a special report on the discharge of Provo River. This work as I understood the order was completed and a copy furnished you.

Yesterday I had occasion to examine the transcript,and I find in Mr. Ray's motion the application for average Provo River 1889-1918,-- a composite of 1889-1905 and 1905-1918. This composite has not been made,and I desire to know, now that you have examined the report, if you wish the average river for the period 1889-1918.

Kindly advise me in this matter,and I will be pleased to include in the report all matters you may designate.

Very Truly,

T. F. Wentz.

Commissioner.

Note: March 1,1919. To this date I have recieved no reply to above.

T. F. Wentz.

Commissioner.

Salt Lake City,Utah.

Gentlemen:

I am delivering by Mr. Thomptson to Richards & Richards one copy of "Commissioners Special Report 1918".

I suggest that Richards & Richards may retain copy until Dec. 2, and then deliver the same to Utah Power & Light Co.,and they may forward same to Mr. Ray about Dec. 5., however, you may arrange the time to suit your convenience. I do desire that Mr. Ray shall have ample time to go over the matter,as I expect he will present this to the Court. In case either of you are crowded for time,I will try and arrange to let you have my copy for a couple of days.

The two plates on precipitation will be furnished as soon as completed.

It is also advisable that you return copy to me before session of court that the additional data may be inserted,or I will forward the same and you may bind in proper place.

Very Resp.

T.F.Wentz.

Commissioner.

Note. March 1,1919. All of the information completed since Nov. 27,1918., has been forwarded to H.L.Stoner.

T. F. Wentz

UNITED STATES GEOLOGICAL SURVEY
WATER RESOURCES BRANCH

Monthly discharge of Provo River at near Provo, Utah
for the years 1893-1896 Station established July 27, 1889
[Drainage area, 640 square miles.]

YEAR 1893	DISCHARGE IN SECOND-FEET			Total in acre-feet
	Maximum	Minimum	Mean.	
January	280	240	251	15,433
February	280	240	275	15,273
March	775	280	351	21,582
April	928	380	638	39,238
May	2340	564	1237	76,060
June	2260	774	1580	94,016
July	1006	280	431	26,501
August	280	240	249	15,310
September	280	240	258	15,352
October	380	280	348	21,390
November	440	380	388	23,088
December	440	380	413	25,395
The period	2340	240	535	388,638
Note				

YEAR 1894	DISCHARGE IN SECOND-FEET			Total in acre-feet
	Maximum	Minimum	Mean.	
January	380	380	380	23365
February	440	380	391	21,715
March	630	440	485	29,575
April	1084	564	687	40,880
May	1860	851	1449	89095
June	1940	380	1110	66050
July	440	240	312	19184
August	330	240	247	15187
September	500	240	430	25587
October	440	380	380	23365
November	440	330	375	22315
December	440	240	341	20,967
The period	1,940	240	549	397,285
Note				

YEAR 1895	DISCHARGE IN SECOND-FEET			Total in acre-feet
	Maximum	Minimum	Mean	
January	508	292	341	20,967
February	389	292	326	18,105
March	968	292	421	25,886
April	1050	444	683	40,641
May	1760	968	1216	74,769
June	968	292	542	33,251
July	292	220	261	16,048
August	220	192	215	13,220
September	254	192	209	12436
October	254	254	254	15,618
November	338	292	300	17851
December	338	292	303	18,631
The period	1,760	192	423	306,423
Note				

YEAR 1896	DISCHARGE IN SECOND-FEET			Total in acre-feet
	Maximum	Minimum	Mean.	
January	444	256	322	19798
February	339	292	298	17141
March	728	292	398	24471
April	1518	390	629	37428
May	4150	581	1166	71,694
June	3345	444	1558	92,707
July	728	292	384	23611
August	444	292	311	19122
September	339	292	309	18,387
October	339	339	339	20,844
November	511	339	421	25041
December	390	390	390	23980
The period	4,150	292	544	394,224
Note
