

# Kennecott Utah Copper

Next time you flick on a light switch, watch television, drive your car, or use your toaster, think about copper. Copper is used in everything from plumbing and wiring to roofing...from heavy machinery to portable CD players...from coins to blue fireworks.

As the second largest copper producer in the United States, Kennecott Utah Copper produces over 17% of America's copper output. The computer you sit in front of contains copper wire and it may have come from Kennecott.

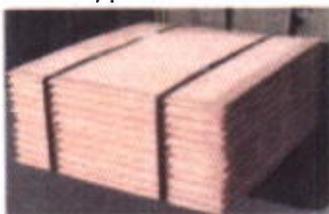

This copper comes from Bingham Canyon Mine, the world's first and largest open pit copper mine, located about 28 miles southwest of Salt Lake City, Utah.

Every year, Kennecott produces about 300,000 tons of copper cathode - along with 400,000 ounces of gold, 4 million ounces of silver, about 24 million pounds of molybdenum, and about 1 million tons of sulfuric acid, a by-product of the smelting process, which is used in farming and industry.

We sell our products to a broad base of copper fabricators and major bullion dealers throughout the United States. Eventually, some of this copper may find its way into the coins in your pocket...your telephone, fax machine, or refrigerator...the cooking utensils in your kitchen...and the appliances you rely on every day.
