

SANTA CLARA RIVER DISTRIBUTION SYSTEM

- - 1951 ASSESSMENT - -

\$1,300.00

BASIS OF ASSESSMENT

The Santa Clara River System water user's assessments are based upon the individual ownership of court decreed water rights and not upon an actual yearly delivery of water.

Therefore, the 1951 and future assessments are to be calculated as follows:

- a. Determine the amount of increase or decrease of the current yearly assessment over that of the previous year's assessment.
- b. This increase or decrease is then applied against each individual's last yearly assessment.

Explanation:

1950 Assessment = \$1,275.08

1951 Assessment = 1,300.00

\$1,300.00 divided by \$1,275.08 equals 1.019543872 increase of the 1951 assessment over that for 1950.

1.019543872 times each individual water users 1950 assessment equals \$1,300.00, or the 1951 assessment.

Note: "This method of calculation eliminates the lengthy amount of detail work as performed in past years where the increase or decrease was applied against the yearly Priority and quantity of water. The end result is the same and such method will more than pay for its use when applied against the Deaver System which is operated by the same principle as Santa Clara".
