

# Items to Discuss

1. Introductions
2. Safe Yield
3. Priority Regulation and Subareas
4. Next Steps

# What is Safe Yield?

- Multiple estimates in published reports:
  - 18,400 acre-feet/year (after including inter-basin flows)  
Budget report: USGS SIR 2017-5033  
<https://pubs.usgs.gov/sir/2017/5033/sir20175033.pdf#page=36>
  - 22,000 acre-feet/year  
Model report: USGS SIR 2017-5072  
<https://pubs.usgs.gov/sir/2017/5072/sir20175072.pdf#page=68>

# Safe Yield – Our Analysis

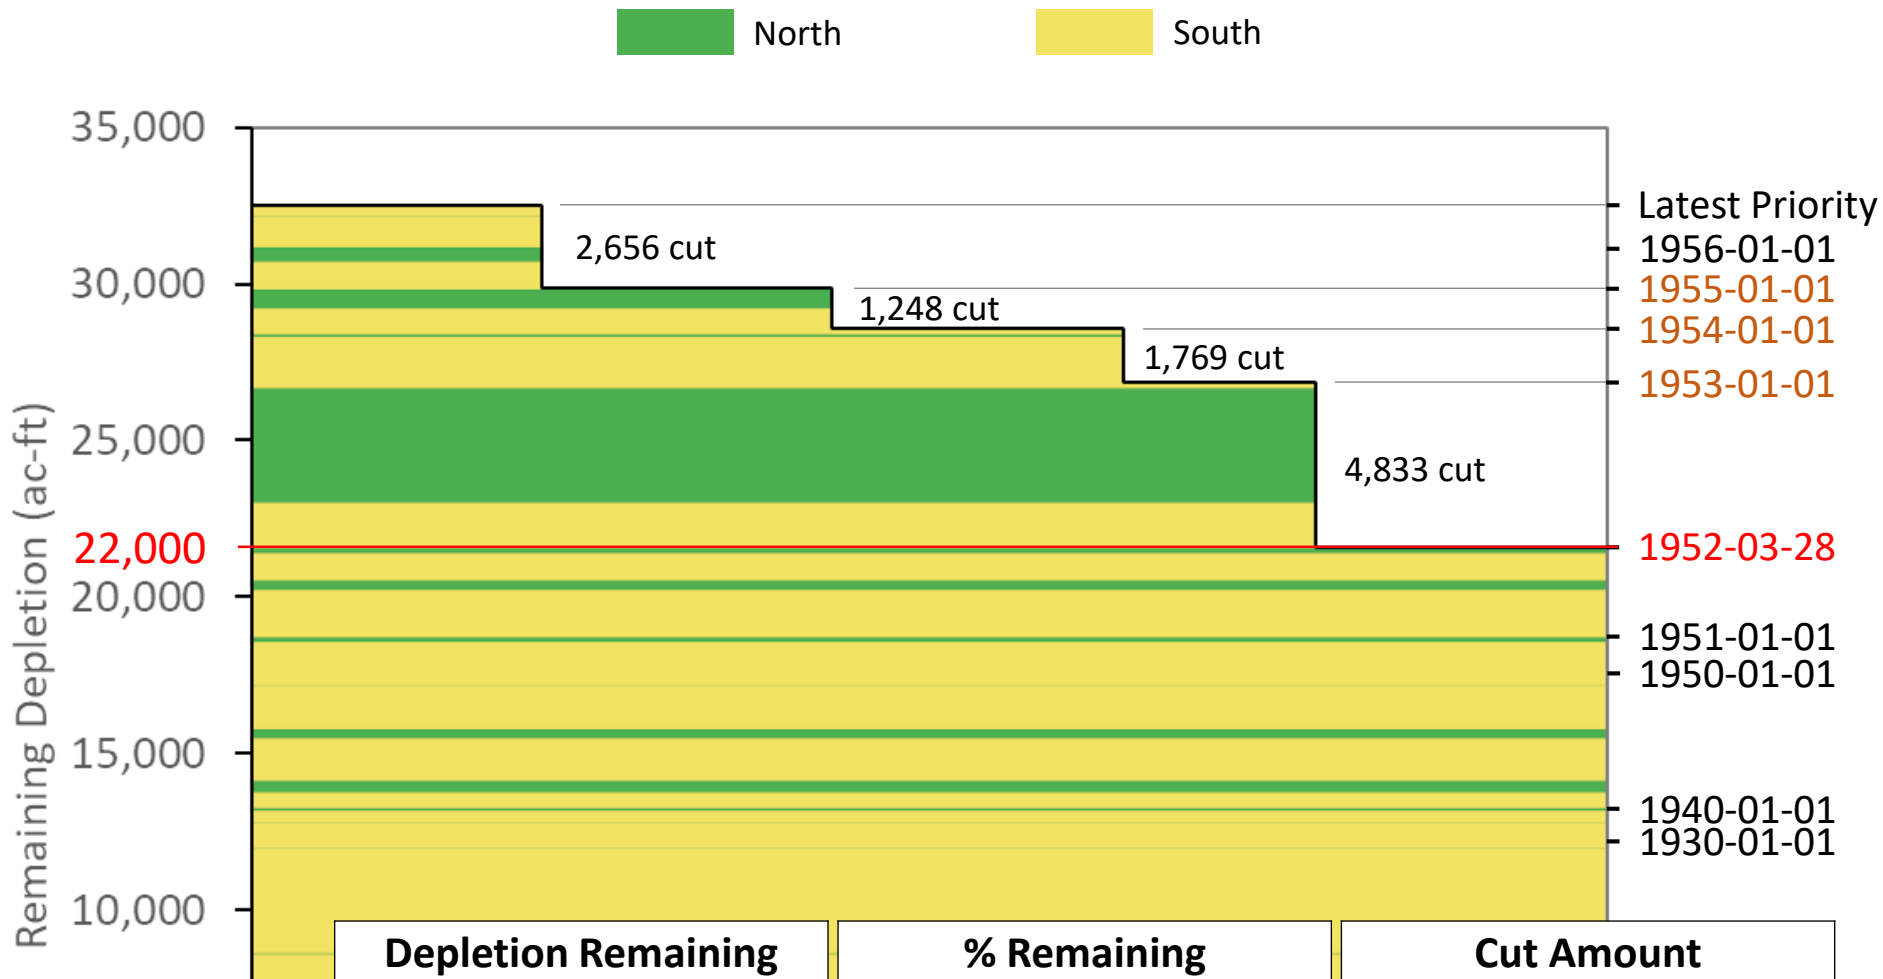

$$\text{RECHARGE} = \text{DISCHARGE} - \Delta\text{STORAGE}$$

<b>2000-2018 Budget</b>	<b>Amount (acre-feet/yr)</b>
Natural Discharge (ET)	200
Well Depletion (assuming 5% returns)	32,100
Change in Storage	10,900
<b>R = D – ΔS</b>	<b>21,400</b>

**Safe Yield:  
22,000 ac-ft**

# Priority Regulation & Subareas

	Depletion Remaining			% Remaining			Cut Amount		
	Total	North	South	Total	North	South	Total	North	South
No Regulation	32,506	7,028	25,478	100%	100%	100%	-	-	-
1 <sup>st</sup> Cut (1955-01-01)	29,850	6,522	23,328	92%	93%	92%	2,656	506	2,150
2 <sup>nd</sup> Cut (1954-01-01)	28,602	5,904	22,697	88%	84%	89%	1,248	618	631
3 <sup>rd</sup> Cut (1953-01-01)	26,833	5,806	21,026	83%	83%	83%	1,769	98	1,671
4 <sup>th</sup> Cut (1952-03-28)	22,000	2,148	19,851	68%	31%	78%	4,833	3,658	1,175

How would the hydrologic system respond to this priority regulation?

# Connection between North & South Subareas

- Administratively divided by Southern Boundary of T32S
- No change applications between subareas are allowed
- But north and south subareas are hydrologically connected (to some degree)

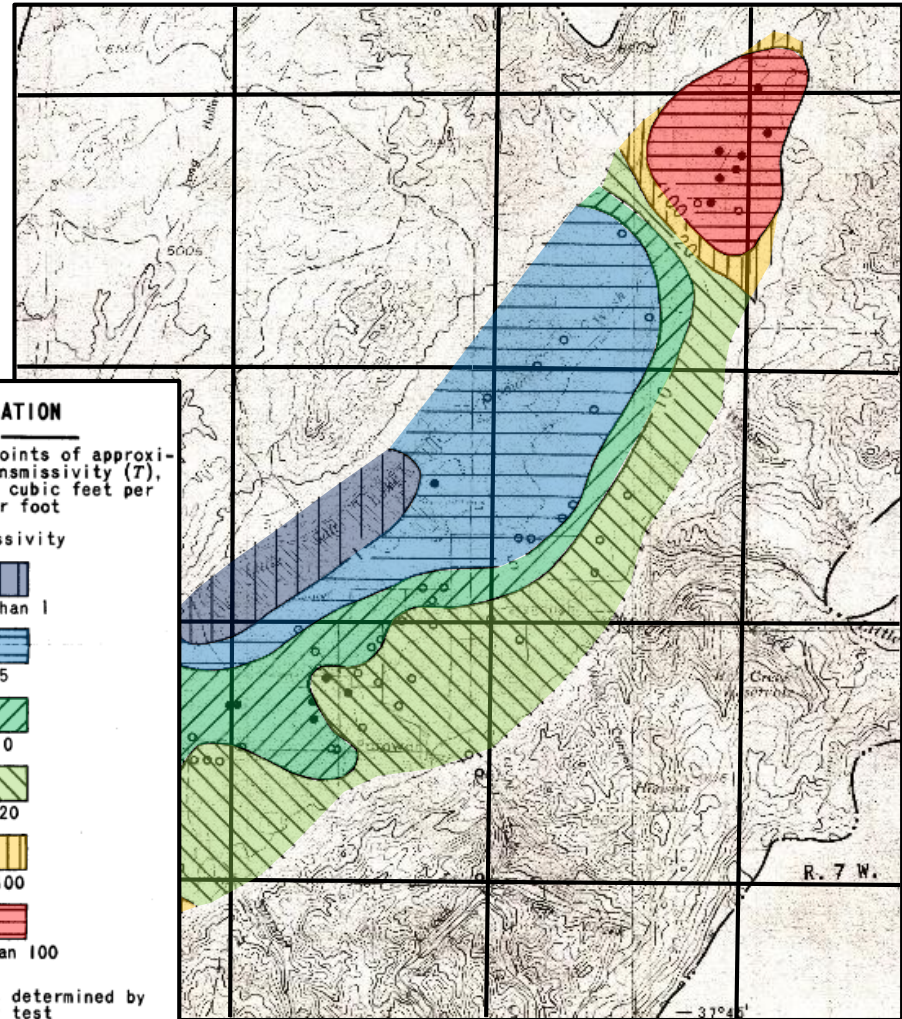

# Degree of Hydrologic Connection

Satellite Map (for Reference)

Aquifer Transmissivity Map

22,000 - Natural Recharge  
7,494 - Natural Discharge  
16,000 - Well Discharge  
-1,494 - Change in Storage

Add Well | 5000 afy

22,000 - Natural Recharge  
0 - Natural Discharge  
31,000 - Well Discharge  
-9,000 - Change in Storage

Add Well | 5000 afy

22,000 - Natural Recharge  
0 - Natural Discharge  
22,000 - Well Discharge  
0 - Change in Storage

Add Well | 5000 afy

How would the hydrologic system respond to priority regulation of entire basin together?

At first, water levels would:

- Continue to decline in the southern subarea
- Rise in the northern subarea (with possible temporary return of phreatophytes and springs)

Over time, water levels would stabilize.

- Time for stabilization may be long (unreasonably long?)
- Water level changes may be large (unreasonably large?)

# Priority Regulation & Subareas – Summary:

<b>Priority Regulation Issues</b>	<b>Entire Basin Together</b>	<b>North &amp; South Separately</b>
<b>1<sup>st</sup> in time is 1<sup>st</sup> in right</b>	Strictly Observed	Rights in south would be cut despite having a better priority than some unregulated rights in north
<b>Risk of large groundwater level decline in south before eventually stabilizing</b>	Higher Risk	Lower Risk
<b>Risk of (temporary) return of phreatophytes and springs</b>	Higher Risk	Lower Risk

# Next Steps

- State Engineer Authority
- Collaboration with Local Community
- Forming a Local Community Group
- Future Meetings to Develop a Solution
